Could someone at least send me the LENGTHS, in bytes,
of the files on the Sparta 3.2 distribution disk so
I can laboriously reconstruct what is now my only copy...

Brent

2. Re: Weekly Posting of New

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-01 05:47:40 UTC

"Does anyone know whether the specs were ever relaxed even
further between now and then?"

The specs for Class B *must* have been tightened up since the early
80's, as there is no way the original (the ones that used the 2-pin
power adapter) VIC-20's could pass current FCC specs. If you have
ever seen one of those early VICs in operation (especially with the
original RF modulator attached) you know what I speak of.

3. Re: Power supply for 1200XL

Newsgroup: comp.sys.atari.8bit

"Q: Can I use my 800/400 9vac power supply for the 1200?
Or does it use a different voltage?"

The 9VAC power supply from an old 400/800 (or 1050 drive) works fine
with the 1200XL. I've owned all three machines (as well as a couple
of 1050's) so you can trust me on this.

b> another that used artifacting. When I went back to split
b> video the problems vanished. Strange.

What exactly needs to be done to get split-video on the XL? If I remember, it entailed adding a capacitor, and a jumper wire to the Monitor DIN. A local user did it years ago, but won't tell me (He forgot what he did, and won't open it to look.) And no one can find the dox anymore.

Thanx in advance.

5. Huge modern software

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-01 20:37:58 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <2g4mv7$i7I@usenet.INS.CWRU.Edu>
Source record: 103634

People have been talking about 30 meg software for their IBMs,
etc. Does anybody suspect that at least some of the reason for
the huge code is software protection? I guess I'm suspicious
by nature, but I just don't see that much to a word processor
or game that takes that much space.

6. Re: Atari as X10 controller

>be using for my TW523 -> Atari interface. Unfortunately, the company went
>belly-up (I think) shortly after I bought the gadget. I tried calling their
>number once, and got a Wal Mart! (sigh).

The company I worked with at the time, bought the rights to the R-Verter
when A.I.D. stopped production. We used them for our character generator
products, but eventually ran out of stock, and didn't make more of them.

Sadly, I found them not very reliable, and not flexible enough for
commercial applications. That's the reason we never made more of them.

>themselves. They had the annual "West Coast vs East Coast" computer trivia
>contest & when Bill Gates posed the question, "There is a contest on Internet
>to write the most obsc, arcane
> progam in C that still actually does something. Nae that contest!" Philipe
>Gasse <sp?> responded "Microsoft Windows!"

Yeeehaaa!

I heard that someone was 'removed' from some kind of meeting chaired by Mr. Gates, in which some Windows derogatory comment was made. Buggers, I can't remember the quote, only that it was funny. Anyone else know what I'm talking about?

Here's one I do remember. I was showing a friend a software IBM emulator than runs on my Amiga computer. I made some kind of comment that it takes a high end Amiga just to get the thing to run at like 'XT' speed. He instantly replied, "Oh yeah, we have the same thing in the IBM world. It's called Windows." :-)

One More:

Is Windows a Virus? (Note: Would make a great T-Shirt) :-)

Q. Is Windows a virus?

A. No, Windows is not a virus. Here's what viruses do:

1) They replicate quickly -- okay, Windows does that.

2) Viruses use up valuable system resources, slowing down the system as they do so -- okay, Windows does that.

3) Viruses will, from time to time, trash your hard disk -- okay, Windows does that too.

4) Viruses are usually carried, unknown to the user, along with valuable programs and systems. -- Sigh.. Windows does that, too.

5) Viruses will occasionally make the user suspect their system is too slow (see 2) and the user will buy new hardware. Yup, that's Windows, too.

Maybe Windows is a virus.

Nope! There is a difference!

Viruses are well supported by their authors, are frequently updated, and tend to become more sophisticated as they mature.

So there! Windows is NOT a virus.

(source for the above unknown)

9. Re: Weekly Posting of New

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-01 21:09:32 UTC
From: jharris@cup.portal.com
Message-ID: <99709@cup.portal.com>
Source record: 103638

I really hope this doesn't offend anyone, but that West vs. East programming question reminded me of something interesting.

Most of you are probably aware of the Atari Assembler/Editor cartridge, and its almost legendary speed problem. I mean, it assembles barely in excess one 1 line per second. That's like 1,000,000 machine cycles to assemble one instruction. Another 6502 programmer and I talked about it for awhile, and we came to the conclusion that it would be very difficult to write such an application to run so slow, without using delay loops and other wasteful structures. To be legitimate, one would have to keep in mind that the original author did not have a specific goal to slow things down, and to try and duplicate it without including code that was obviously intended solely to waste time.

Now it's not that I consider this a particulaly useful exersize, but it is a difficult one, and I realistically don't think I could do it.

Again, no insults are expressly intended by quoting this example.

Strangely, in one of my early Newsletter articles entitled, "The Quest for the Perfect Assembler", I actually reviewed Atari AMAC as being slower than the ASM/ED cart. While many people laughed at that, I did include my timing tests, and I thought I was completely justified. You see, I timed the test assuming I had just found a program bug, and needed to fix and reassemble the code. With ASM/ED, I jumped back to the editor, where my source was still resident, made the change and assembled the program. Then comes the customary trip to get something to eat, or whatever. Anyway, when it was done, it's back to the debugger and test. With AMAC, you quit to DOS, load the editor from disk, load the source code, edit and save the source code, quit to DOS, load the assembler, load the source code again, assemble the object to disk, back to DOS again, load the debugger (*), load the object code again, and you're ready. Needless to say, I didn't use my high speed LE Systems drives for this test, since most people wouldn't have these, and timing using the 810 came out significantly longer than with ASM/ED. The test was even worse when I used Atari DOS instead of CP/A, (or maybe OS/A+ by that time), and had to deal with DUP.SYS loading time. Plus, the delay was split up between many smaller delays that required continuous attention and user input. Anyway, with a nice hard drive, AMAC obviously gets much better, but it was still not one of my favorites.

(*) This step assumes that you've gone out and bought a debugger elsewhere, since AMAC inexcusably did not provide one with the package.

John Harris - jharris@cup.portal.com

10. Atari 8-Bit Computers Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-02 00:30:32 UTC
From: MCURRENT@carleton.edu
Message-ID: <01H76F4Y3O768ZE43Q@carleton.edu>
Source record: 103639

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 27-Dec-93

Additions/suggestions/comments/corrections having to do with this
FAQ List are welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The Atari 8-Bit Computers FAQ List is posted on or about the first of the
month to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group.

What is this FAQ List for?
The Atari 8-Bit Computers FAQ List was created to provide answers to many
commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest
discussion group. At this time the FAQ List is heavily geared toward
describing the various resources for the 8-bit Atari user available, with
relatively little information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)
Hence no automatic archiving of this FAQ List occurs, though there's usually
a fairly recent copy on the Atari Archive (see below) as the file
8bit/faq.txt.

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
```

rec.games.video.arcade (includes products by Atari Games)
rec.games.video.atari (Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
The Atari Archive is that section of the University of Michigan/Merit Software Archives that holds a huge number of files covering all Atari products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit Software Archives mirror site, but there's no guarantee the site you're taken to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher client, try the command "gopher gopher.archive.merit.net 70" to connect directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file

describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.51). Applications for free accounts are
handled online, or you may browse the system as a visitor. Once logged-in,
type "go atari" to reach the Atari SIG. Those who add their names to the Atari
SIG user directories are automatically members of the official Atari user group
C.A.I.N. - Central Atari Information Network. Send correspondence and press
releases to xx004@cleveland.freenet.edu.

What print magazines support the 8-bit Atari?

What product developers or vendors support the 8-bit Atari?
There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the Atari 8-Bit Computers FAQ List, and is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.txt, or you may contact the maintainer at mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides
subdirectory and hard-drive support. SpartaDOS is a completely different
command-line DOS modelled after MS-DOS, though it is perfectly capable of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS
X is cartridge-based and includes many additional features. While it's hard to
argue that SpartaDOS X is not the most advanced DOS available, it is a
commercial product that is no longer manufactured. MYDOS, on the other hand,

is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for
complete compatibility with existing software, and then choose either SpartaDOS
or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????, a U.K. variety...
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7- or 9-pin??? dot matrix)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari BBS?
The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained
by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

Where is my nearest 8-bit Atari user group?
An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King. [e-mail address needed]

>or game that takes that much space.

What kind of protection? Most PC software is not copy protected at all these days, other than perhaps some of the games.

I know that for Word Perfect 5.1, which take anywhere from 1.5 to 4 megs, a large part of the supplied stuff (like a meg or more) is graphics images and things you can import into your documents. The dictionary takes up about 1/2 meg, and the thesaurus the same (as I recall) and both files are stored in compressed form, as Stacker and PKZIP have little effect at shrinking them. The actual word processor takes up a total of about half a meg (I think) ... its hard to tell for sure cause they uses overlays for all kinds of modules to minimize memory usage. WP5.1 is the only one I am closely familiar with cause I run it on a floppy only system with 720K floppies .. a real treat.

>

Believe it .. the job of the compiler, and perhaps the hardware, to speed
things up. Step one .. compilers .. which expand code by a factor of 3 or
more, and reduce performance by a factor of 2 or so. Step two, RISC
processors, to get back the speed, but they expand the code another
factor of two or more. ANd compilers almost never optimize for size,
they seem to be sold by how fast their code is, not how tight.

Thing is ... think how fast RISC chips might be .. if programmed in
Assembly! Mindboggling.

: Oh heavens. I hope nobody really believes that.

Way too many people do... I've heard this in several places. Programming
on Sun systems, I've been told/taught pretty much the same thing as well.
Dumb, really dumb. I rarely rely on the compilers tho... I prefer squashing
the code myself THEN having the compilers try to optimize it even further!

Oh-yeah! I've finally figured it out! I was wondering why program size
has so exploded over the years...

Many of the packages I've seen from the Golden age of computers used so
many "tricks" of each system to get every ounce of performance, maximum
graphics, sound, you name it... it could only mean one thing - HACKERS!
Sure, most software companies of the time used moderate programmers also,
but I've read some articles pertaining to older software productions...
wow... lots of hacking here and there to get the silly thing to work. Many
times, a programmer would take over to "finish" the program. I consider
myself a hacker and I conform to the notion that hackers don't write
programs, they just plug away at something until it works. I've written
some programs, but I don't think I could ever say I'm done with any of them.
I don't think any hacker is ever satisfied with his work completely...
there's always one more thing that "could've been done better".

Now-a-days, I think the programmers have taken control. The machines are
so darn powerful with memory and storage capabilties so huge and cheap,
unless the program's taking the machine to the point of breaking/melting,
"why bother hacking" a simple shoot-em-up, word processor, etc. Today is
the day of "patchwork programming". A windows-based interface for this, a
3d graphics engine for that, sound drivers, card drivers, etc. It's already
done, just piece together what's needed, and poof! Out comes your product!
A company writing for the IBM-world would be crazy to optimize their code
for a single graphics card with a certain sound card and machine type and
speed combination. Each system has so many potential variables, you need
mega-bits of information in each program just to stay compatible!

Wow, this reply was supposed to be short,
hmm, guess I could go back and chop some...
and that last paragraph was a bit... nahh!
-Tim

(We're talking about huge IBM/Mac programs.)
The question was what protection.
I have Chess Master 3000. It has an exe file over 1/2 meg. It does do a lot, but I don't think it really requires 1/2 meg. If someone wanted to mess with the code with a disassembler, it would be impossible with a file that size. CM3000 makes (made) me think it wasn't copy protected. But when I re-format the hd and restore the hd with a backup, CM3000 says 'new configuration, re-install.' That means it has recorded the volume # or other info about my hd and won't run on a re-format. Huge code could be explained with the inclusion of a lot of graphics in the code. But even so, it makes dis-assembly/reverse engineering practically imposible.

Ah yes .. the huge EXE file syndrome.

I have never delved into the details of EXE file structure, but I strongly suspect that sometime or other over the last few years a number of compilers have moved from using separate overlay files to having the overlays included as part of the EXE file. We have one network analyzer program at work which is over 700K. Now the program runs on a plain XT clone with probably 512 K of free memory, so you know most of that code is overlays.

What would be needed would be a disassembler which did not treat the whole EXE file as one chunk, but was smart enough to separate out the overlay structure. I am not terribly familiar with disassemblers (current) but have run into the kind of problem with the one I have used, Sourcer. An old version though, maybe the new one is smarter. ANother disassembler I have looked at, but never used, sort of take a toolbox approach, with the disassembly proceding a step at a time. I think it was called Masterkey?

As far as code expansion and compilers goes, as an example, as soon as you include one printf statement in a C program, all of a sudden the compiler stuffs in the entire STDIO subroutine package, expanding the size of the program a great deal. Similarly for the math routines and such, one call to a math function (say a sine or cosine) and pow .. your program grows by the size of the whole math library.

SUch is life. I ended up going back to Multiplan as a spreadsheet for my floppy only laptop, as it took up about 90K total, versus Lotus 123 at 500K plus. Now Lotus does have more functionality .. say maybe double that of Multiplan, but that would only grow it to 180K. The rest is all because it was written in C rather than assembler.

18. 360K(DS/DD) full-height floppy drives

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-02 19:53:20 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00977F07.941AEC00@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103647
Cross-posted to: misc.forsale.computers.other,misc.forsale,misc.forsale.computers.pc-clone,comp.sys.atari.8bit,comp.sys.tandy

I have a couple of Double sided/Double Density 360K (IBM compatible)
full height floppy drives. These were used in IBM PC&XT, also usable
in other computers such as Radio Shack/Tandy, Atari with the right
disk interface, Texas Instruments, CP/M systems, etc. These are the standard
Tandon TM-100-2A drives.

If interested, and can use these, please make offer. I am hoping to
get more than $10 each. All are in good working condition.
Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU
Thanks!

19. Atari, Intellivision, other games for sale

Newsgroup: comp.sys.atari.8bit

```
Game cartridges for sale, for Atari, Intellivision, and other.
I'll sell to reasonable (good :-) offers. Please make offer by the piece,
no need to buy everything.

Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973.
Thanks!

Atari 2600 items for sale:
High quality game joysticks (various types).
Atari paddles
2 Atari catalogs from different dates.
CARTRIDGES-

Q*Bert
Phoenix
Jungle Hunt
Epyx California Games
Epyx Winter Games
Absolute Entertainment Skate Boarding
Spectravision Gangster Alley
RealSports Football
U.S. Games Towering Inferno
Coleco Donkey Kong
Mattel Space Attack
Indy 500
Activision freeway
Video Pinball
Apollo Shark Attack
Moon Patrol
Solaris
Pole Position
Astroids
**************************************************************************

Intellivision cartridges-
All except BurgerTime have original boxes, some have manuals and overlays-

Las Vegas Poker and Blackjack
The Official Carnival by SEGA
TRON MAZE-A-TRON
Snafu
Reversi
Donkey Kong
BurgerTime
**************************************************************************
```

Other cartridges-

Odyssey2- Casino Slot Machine!
Atari 7800- One-On-One
Atari 5200- Pac-Man

I also have a lot of games for the TI-99/4A, as well as the machine itself, joysticks, speech synthesizer, etc. List available upon request. thanks!

20. 1994 UPLOADS to umich

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-03 06:13:55 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJ1In9.FoJ@utnetw.utoledo.edu>
Source record: 103650

Just (FINALLY) made it into the umich 8bit archive and left a few new year's presents for all the good little 8-bit'rs still hacking away on their faithful machines! I sent this msg to Jody Lenn just a while ago, and with any luck, the files should be available within a couple days from the /Adventure and (most likely) the /Demos subdirectories.

-Tim

PS: Oh-yeah! Forgot to bring this up last time when I batch-u/l'd a load of adventures to umich - if anyone out there has trouble running one or needs some help getting through, just ask! I think I've solved all of them! Remember, too, all these mini-adventures will have a LIMITED VOCABULARY. Those spoiled by Infocom, all I can say is, "GOOD LUCK!"

Filename.: LOOKWHAT.ARC
Title....: Audio samples and players
Author...: Tim Muszynski
Date.....: 04/08/88
Sponser..:
Language.: M/L
Category.: Demo - sound/audio sample
Breakdown: LOOK.OBJ, WHATDONE.OBJ
General Description:
These are two audio samples I took
and set to executable form years ago.
Back then, no one was really interested
in digitizing audio for computer
playback. The actual program code is
mine. What I've included here is a
simple M/L playback routine strapped to

an audio sample. True, they are both crude, but what can you expect from the raw 1.79 MHz of a stock Atari. NOTE: Although there are only two options (play and boot) from the menu, I did NOT trap reset so if you're running some sort of ramdisk, you can just "reset back to DOS". The samples I've included DO NOT intrude on ANY extended memory... just make sure you have basic disabled!

22. I played Atari Tempest on a PC this weekend!!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-03 15:53:58 UTC
From: miskinis@korg.enet.dec.com
Message-ID: <CJ29oI.K7x@ryn.mro4.dec.com>
Source record: 103654
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

Hi Folks,

I must say that I was "blown away" this weekend. My friend
invited me over, the day after New Years, and mentioned that
he had some new Atari games.

Well, I expected to see them on his ST, but he said that they
were Atari games, available on the PC. I expected some lousy
translations, but NO WAY...

My eyes popped out as I witnessed what must be a PORT of the
old(er) vector graphic games, TEMPEST, BATTLEZONE, and ASTEROIDS
running under MS-Windows. THEY MUST BE A PORT AS THEY PERFORMED
EXACTLY AS THE ORIGINALS.

I am syill amazed... He bought all 4 (Centupide included) for
$24, under the title Microsoft Arcade...

Jaw still open to floor,

John Miskinis

I had a package called "S.A.M." the Software Automated Mouth by Don't Ask
Software. There was a terminal program that talked and a game "Poker SAM"
spawned out of the same package.

Brian

25. Next to Last Word on the ICD Buyout

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-03 16:27:37 UTC
From: mjewison@nereid.sal.ists.ca
Message-ID: <1994Jan3.162737.20563@newshub.ists.ca>
Source record: 103505

Once again, rampant rumour and half-truths abound in the discussion of the ICD buyout. I have done a little investigation, and here's what I've discovered so far:

1) Bob Puff and CSS *DID NOT* buy out the ICD 8-bit line. It was bought out by an individual named Michael Hohman, who has set up a company called Fine-Tooned Engineering located in California (apparently not too far from B&C).

2) The confusion regarding the FTE/CSS connection may be due to the fact that Mike and Bob are working together. CSS has contracted with FTE to produce plastic cases for the R-Time 8 clone recently developed by CSS (which is, I believe, scheduled for a March release). As some of you have already reported, CSS has sent out a mass mailing (which I haven't received yet - argh!) mentioning some of this and also announcing their R:P: Interface, a replacement for the long-departed P:R: Connection.

3) All the ballyhoo about SpartaDOS-X not being included in the new releases is utter rubbish. Apparently FTE will be offering much (maybe all?) of the old OSS line *AS WELL AND THE RT-8 AND SDX*. Personally, I would love to get my hands on another copy of SDX and I will wait until FTE releases it rather than send off my money to the thieves who recently announced pirate copies for sale.

I obtained most of this information from Ben Poehland. FTE has placed an ad in the February 1994 issue of Atari Classics which hopefully will make all this clear.

Assuming we can wait that long.

:> they seem to be sold by how fast their code is, not how tight.

:> Thing is ... think how fast RISC chips might be .. if programmed in
:> Assembly! Mindboggling.

This is so true it is scary. From what I've seen, most applications tend to migrate from older systems to newer systems by running on an emulator for the RISC box. And the scary part is, it is usually still much faster than on the original systems. I would like to see more of the new compilers take at least some advantage of the RISC-type features besides cacheing... Optimizations for pipelining, and RISC-type registers, etc. would make all the difference, in much the same way that Atari programmers took advantage of every possible feature they could to get more speed, more colors, smoother movement, and finer sound quality from their 8-bit machines.

Apologies for any straying from topic.

Doesn't it also include Missile Command?

I was amazed when I saw that set up a local store. Using the mouse for Centipede sure beats the old Atari joysticks. When I get that package (maybe tomorrow), it'll be just one more step the 486 takes toward completely replacing the old 1200XL. <sigh>

I haven't seen a PC version of Joust that's as good as Atari's, yet, though. And I haven't seen ANY PC version of Ballblazer, one of the all-time greatest Atari games-- stunning graphics!

Anybody remember "AtariSoft", Atari's venture to sell versions of its games for IBMs, Apples, Commodores, and TRS-80s? Are any of those still around? It might be kinda fun to play a simple game of Frogger on the 486. At least I wouldn't need a CD ROM drive for it!

: How do I upload stuff to umich? Which directory should I use?
: (I couldn't find 'incoming' or something like that)

Thought it best to reply to the general group... this way if anyone else wasn't quite sure... well, thanks for asking!

All the Atari 8-bit stuff is kept in /atari/8bit of course... from here it gets confusing. Most ftp sites have a "New" or "new" directory you can d/l from, usually letting users get EXTREMELY recent u/l's that the sysadm hasn't had time to check validity on, scan for viruses, see if it's really shareware or PD, etc. On umich, the "New" directory is u/l only. Just send you're files up in here and either leave a quick .txt file describing what you've sent - for instance:

```
Filename.:
Title....:
Author...:
Date.....:
Sponser..:
Language.:
Category.:
Breakdown:
General Description:
```

or let lenn@mentor.cc.purdue.edu know what you've sent. It gets "sorted" to the proper directory a bit faster that way (I hope!). I've been hoping to get some type of system going here to give users browsing through the 8bit archives some type of descriptor-file or index (see my .idx files in the Adventure subdirectory)... hard to tell what some of those old files do! If you can, it's best to .ARC the file also. Heck, if you think of it, tell us here in the 8-bit group what you've sent, too - you can get some free "promotion" for your u/l.

Happy U/l'ing!
-Tim

PS: For those wondering what my "system" is, I guess I should describe in a little better detail:

```
Filename.: Name of the file (BIGDEMO.ARC)
Title....: Title of the program (Big Boomer ver 1.1)
Author...: Author of the program (George Arning)
Date.....: Release date (10/14/86)
Sponser..: Software company, magazine or newsletter (M.A.C.E.)
Language.: Basic, Pilot, Assembler (if source code), C (if source), M/L,
```

Action!, Pascal, Logo, Microsoft Basic (shudder!), Text, etc.
Category.: Adventure, Demo - sound/graphics, Strategy, Arcade, Disk
Utility, Graphics (data/image file), Utility (general -
database/filing/recipe/book keeping), Game (general), Printer
- utility/driver/graphics dump, Doc - text record/descriptor
(usually .ARC'd with the software, but some Doc files are
just records of bug reports, email logs of encountered
problems, etc.)
Breakdown: What files are IN the .ARC file (BIGBOOMR.EXE, BIGBOOMR.DOC)
General Description: Go wild... anything goes, but try to keep it semi-
brief, this should be just a simple attention grabber!

(Remember, do whatever you want when u/l'ing, but it is nice to let everyone
else know what it is you're sending... and this way a descriptor/record is
left IN the archive directory so that anyone coming across your file months
from now can quickly see if it's "just what he/she's looking for"!)

31. Two printers connected?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-04 00:44:31 UTC
From: holmanji@ohsu.edu
Message-ID: <1994Jan4.004431.26302@ohsu.edu>
Source record: 103512

My neighbor has an Atari 130XE, two disk drives, and two printers. He has a dot matrix printer hooked up through an RS232 interface, and one of the Atari daisy wheel printers. He would like to have both printers hooked up at the same time and printer to either one merely by turning off the other. However, so far it looks like he can only have one printer at a time connected. He thought about hooking both printers up to some kind of A/B box, but the Atari printer only has the standard Atari serial port, and probably wouldn't plug into anything else.

Also, the Atari printer (the daisy wheel) has what looks like a telephone jack on the back. This jack is not documented anywhere in the manual, but there must be some use for it--otherwise why install it?

By the way, I'm an IBM clone user now, but I had an Atari system for a number of years. I still haven't found a game I enjoyed as much as Conflict in Vietnam, which, I believe, only came out in Atari format. To this day I'm amazed at everything the Atari could do so well.

Thanks for your help.

Jim Holman holmanji@ohsu.edu

32. Atari for sale :(

Posting for a friend, please reply to ehall@monmth-c3tmp.army.mil

Hi y'all! Although I've been holding on to my Atari for the past
few years mostly out of nostalgia, my recent move is forcing me to
sell off my equipment. (Besides, I figure you guys could make much
better use out of the ol' workhorses, than my closet can)
Anyway, I'm selling the following items:

Atari 800XL - Free to anyone who'll give her a good home (and
pay shipping)
Atari 130XE w/ 576K RAM installed $75
(an external switch switches the machine from 576K no BASIC
to 192K with BASIC)
works great as a RAMdisk with SpartaDOS
Happy 1050 drive (FAST, true double density) $75
Happy 1050 drive with Happy Controller $85
(external read/write and speed switches)
Ape-Face printer interface $25
(automatically prints Atari graphics chars on an Epson
printer, requires that you have a 1050 or other 9vAC Atari
device - it daisy chains power from the drive)
P:R: connection $10
(no built in SIO cable, must use separate cable and use at
end of chain, or solder in a new SIO cable - something that
I just never got to after I got my MIO)
R-Time8 $10
(probably needs a new battery by now)
Action! and Action! Toolkit $10
SpartaDOS Construction Set v3.2 $10
De Re Atari $5
(which you old timers will recognize as the programmer's
bible for the Atari...)

manuals for everything (and a manual for OSS DOS XL, which I never
actually bought, but somehow aquired the manual)

manual for the XM301 - free for the taking (I'll even pay shipping!)
(which was my first modem, but passed on to someone else
as their first modem when I bought an Adaptec 2400 for
$200 back in '87...)

like telling a good friend good-bye....

-Erik

I just got done reading the Microsoft Press book _Writing Solid Code_.
It's a great book about C programming such that your code finds its own
bugs and it a lot more reliable. I was reading the author information
in the back of the book, and it had these sentences.

Since then, Steve has been responsible for numerous projects,
including _valFORTH_ in 1982, an award-winning FORTH development
system that allowed Atari programmers to write high-quality
graphics applications and video games.

The author, Steve Maguire, joined Microsoft in 1986 and has been working
on cross-platform development (getting Microsoft Excel to use the same
code base for both Windows and Macintosh versions).

>would be if it was written efficently .. much smaller, much quicker,
>runnning well on machines with much less in the way of resources.
>

I know this is off topic (but not totally), but as a GEOS user I can vouch
for everything you say. The present version is a nice set of applications
running under an efficient multitasking/multithreading OS which runs well
on a 286 and blazes on my 486. The Write and Draw programs have 80-90% of
the bells and whistles on any major Windows apps. Plus a few new tricks
that "the other guys" don't have.

Sounds too good to be true? It probably is. The company is small and they
want to play in the PDA market. No matter how good GEOS is, Windows has
already sewn up the desktop market. Geoworks has suspended development of
their desktop software in order to concentrate their limited resources on
the PDA market. The current PC software version may never hit the stores.
As it is now, the company will sell "version 2.0" directly but have no
plans to go any further at this time. It is a very nice package but, since
development was suspended before they were ready to release it, it has
a few "unfinished" features.

This all goes back to what a previous poster said about "selling as well or
as profitably". Followups to comp.os.geos.

>Believe it .. the job of the compiler, and perhaps the hardware, to speed
>things up.

The hardware point, I regretably have to agree with. Most programmers of
today feel this way.

>Step one .. compilers .. which expand code by a factor of 3 or
>more, and reduce performance by a factor of 2 or so.

These figures need to be padded quite a bit. They are much too low.

>Step two, RISC
>processors, to get back the speed, but they expand the code another
>factor of two or more.

This is really the compiler's fault. Good assembly RISC would probably
be within 25%, depending on the chip.

>Thing is ... think how fast RISC chips might be .. if programmed in
>Assembly! Mindboggling.

Atari Jaguar. We'll get to find out. :-)

36. Atari package deal

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-04 05:12:04 UTC
From: prefect@bigwpi.WPI.EDU
Message-ID: <PREFECT.94Jan4001204@bigwpi.WPI.EDU>
Source record: 103517

Hello Atarians of old (and new?) ...

I've been sitting around the past day or so wondering what to do with my piles (and piles) of 8 bit stuff... It came down to whether I should keep it all because of the strong sentimental ties, or sell it to appease my parents, and pick up some much-needed money... I was a heavy Atarian from 1983 until some time in 1990, when I got my first PC... I still have that want to go back to Atari stuff for some reasons.. But I know it'll never work out for me.. So, I figured the best thing to do would be to save a few tidbits for myself here and there.. Enough to bring back the fond memories.. And sell the rest of my stuff to a worthy Atarian.. I've got a bunch of neat toys that have basically sat in my closet for 4 years ... Among the catchiest: SpartaDOS X, XF551, and a ComputerEyes digitizer, as well as piles and piles of other stuff.. Books, disks, carts, etc.. I'd like for it to all find a good home... :) (Sounds drippy, but it's my life from 4th grade until 9th grade.. :))
While I don't recognize any faces in this group, I'm sure I can relate to many of you... I programmed my Atari for a few years before discovering that it was time to play with hardware on the thing.. My coolest Atari setup was: modified Atari 800XL base unit, with the following specs: PC-style desktop case, internally mounted 1050, internally mounted 850 interface, internally mounted SX212, somewhere around a meg of RAM.. (I forgot how much), external XF551, 1027 LQ printer, Amdek color monitor, detached keyboard (custom hack), internal cooling fans, internal uninterruptable power supply, special hookup for a Nintendo Advantage joystick, and a robotic arm interface. (*whew*..)
Unfortunately, this system got toasted (except for the external stuff, and the 1050).... hate it when that happens! :)
Now that you've got a bit of my history just for posterity, here's my list of stuff that's for sale... I'd *absolutely* like to sell this as a single bundle, for $350 (I'll talk).. It'd be a real pain to split up the components. If you're an avid Atarian, or a someone wanting to become one, pick up this bundle.. It'll keep your system running, it'll add on to your existing system, or it'll BE your new system. So.. here's my list... Prices can be flexible, but like I said, I really want to sell the whole thing as a package.

Thanks!
Steve Richardson (prefect@wpi.edu)
(please respond via email, probably the best way to reach me)

==========

Condition Key:

N - Basically as new as it gets.. :) .. Has almost everything with it, works.
E - Excellent.. Very new condition, works, probably has manuals
G - Good.. Still works great, but might have surface flaws (scratches, etc)
F - Fair.. Works, but might have other weird problems, or is just old.

P - Parts.. Most likely is dead, but chock full of useful parts.

Manual Key:
Y - Yes, includes original manual
N - No, doesn't include manual
P - Yes, includes <cough> photocopied manual.

There is an excellent article in the latest ATARI CLASSICS (FEB?) on
video. Chroma output is missing in the XL series. There were also a
couple of articles in ANTIC describing how to fix this shortcoming
(They are also referenced in the ATARI CLASSICS article). If you're
interested in the 8-bit Ataris, ATARI CLASSICS is must reading.

P.S. No, I have no connection with the magazine other than being a
very satisfied reader.

You're in luck. CSS has a device known as the Deluxe Quintopus, which
gives you extra SIO connections as well as 2 switchable ports for
those with 2 printers. It's on sale till 1/31/94 for $44.95. Their
number is (716) 429-5639 (10-5 EST).

While you can address the first disk drive on an 8-bit system as D:, you
can also use D1: through D8: (where only the first four are normally
real drives). By the same token, you are not limited to addressing the
printer as P:, although that always works as long as you only have one
printer connected. I found with some experimentation that I could have
my regular printer AND my 1020 connected to my 8-bit, and just addressed
them by the number that was apparently built in. For instance, the 1020
can be addressed as P4:. Experiment and see if this helps.

Ah-HA! Since you seem to know a bit about Newell, maybe you can help me out?
I'm trying to find what chip/OS setup/??? I need to be able to do the following:

Set up my ramdisk as one (or two) 90k drives, one configured as D1:, hit a
switch or couple of combination keys and BOOT from the ramdisk(s). I've seen
this done on a 1200xl in or around 1985 with a 256k expansion. I don't know
what ever happened to the guy who had it, and I don't recall what system mods
he had made to the computer... Newell sticks in my mind though! Any ideas?
Worked great for recovering bad disks, etc. since you could just copy the whole
disk to a ram partition, re"boot" the system and load up a disk analyzer, fix
the disk stored in ram, and then hit a couple combination keys, changing the
ram drive to D1: and then booting it to make sure the temporary mod actually
fixed the "disk"! I've seen this done, and it's pretty slick... but with the
passage of time, I have no idea what ever happened to the guy or his old 8-bit
machine.

If Newell has something like this, is there someone I can contact DIRECTLY
to check in about this? I've called Newell before, and the people I've talked
with HAVE NO IDEA WHAT THEY'RE SELLING - must be a answering/ordering service!

Argh, I was hoping someone would reply by now, but so far nothing... shoot!
Well, hold on, I know there's a way... should only cost you $5 or $10 max.
I knew someone back in 1983 or so - he had two printers connected full time.
He could select which one to print to by turning one off, etc. just like you
were thinking. I'm sure (I HOPE!) someone will post some type of description
how. I've never needed to check into it myself, so I never delved into the
technical means. I know there was a universal printer interface that also
did the same job around 1982 or 1983... Gorilla? Or... something... you'd
hook the printers into it and it had a switch or special wiring or... yiee
- I'm lost now. Can't adequately describe it. I think I'll let someone
who knows a BIT more about it come forward and help you out... (PLEASE!?!)

Message-ID: <CJ54F4.Jo4@utnetw.utoledo.edu>
Source record: 103531

Brent Buescher (buescher@ugcs.caltech.edu) wrote:
: Philip Price posted here a while back and volunteered to put some
: Alternate Reality source code on the archive. Haven't checked to
: see if it's there or not.

For those curious, I've checked the archive a couple times... unluckily,
I can't find any trace of the Alternate Reality sources, demos, lists, or
anything EXCEPT in the MASSIVE scrolling root /8bit directory, ALTREAL.ARC.
Warning: this is only a general email capture of several users learning to
play Alternate Reality: the City. If you need some hints, grab it.

Does anyone have any of the old:
- potion lists (odor, taste, color, -=> what it is)
- level/experience correlation
- helpful hints of the game
- worst to best weapons, armor, clothes, whatever
- player "resurrector" (I think I have one for the City... also opens up
the small area South of the Arena for exploration (nothing major) and
can modify your player's stats (I particularly don't like this feature))
(I'd love to get one for the Dungeon though! Their lose-ability-stat
resurrector is nasty... and I hate to keep backing up the whole disk!)
- any "printable" maps for an Epson-compatible or OTHER printer? I know
straight ASCII or Atascii can't work - too much detail for each square
of the 64x64 grid (it was 64x64, right?)...

Anyone up to getting a copy and going through parts again (with me)? I'd be
willing to start a fresh character and help anyone through it... it's been ages
since I've played either the City or the Dungeon. I tinkered with the Dungeon
a couple years back, but the City... wow, long, long time, no see/play/
experience. I have the computer hooked through my stereo currently. Never
had a chance to hear a rainstorm or thunderclap through my speakers yet.

BTW: yes, thanks to one user, I've have been able to email Philip, but I've
had no replies as of yet... :(Maybe next week?!?

What you describe can be done with CSS's Ultra Speed + Operating System (US+ OS). Contact Bob Puff at 76702.1076@compuserve.com for details. I have one and highly recommend it. It's on sale this month for $54.95.

: Thanks for your help.

: Jim Holman holmanji@ohsu.edu

I have an A/B Box for my system that has 3 serial connectors. An input,
an A and a B. Really simple to build one yourself if you wanted too.
The only tricky part would be to get the multiple throw switch. This
box was originally used to switch between printers, but now I use it to
switch between drives (which are both designated drive 1). I will
someday start using it again for printers, once I can manage to get
a ribbon for my Integral Data Systems 460 (ancient!).

Epyx had a game (2 player) strategy/action where you shot balls into a field like a bumper pool table with paddles that rotated 90 degrees. I remember that it used a modified character set to create the board, and it was in basic. I loved that game to death, and in a dream, I saw it again.

What was the name? Does anyone remember this, or better yet, have a copy? I still hve it, but no floppy drive anymore. I would love the source code (if I could provide my manual page as proof I would) or aport to the pc, but whatever...

Even the name would be great. Ok, the name and a floppy drive, but who's asking?

Send here or to me by email...

Thanks!

Michael Wexler
Wexler@gibbs.oit.unc.edu

8bit forever! Gotta love those 6502 opcodes...

The game was called Ricochet, I think the copyright date was 1982.

I don't think it was very popular; I do remember seeing a review of the game in Byte when it still covered home computers.

It was a long way back, I think sometime around November 1982. There was some Games issue which lasted two or three years, then died out as the focus of the magazine changed.

Ah well. I feel old, even if I was only 10 when I read the review...

Hello Albert! I already got replies about Action! and the toolkit, but
if I don't hear from them in the next couple days, then they're yours...
About the Happy dives, they've got many advantages over stock 1050s:
They're faster (MUCH), you'll notice it the first time you boot up
and hear the beeps. If you use SpartaDOS, then they run even faster
Happy drives support true double density, meaning you get 180k on a single
sided disk
They can also duplicate any disk. Using the included software, you can
make backups (copies) of even the most heavily protected disks. It doesn't
break the protection, the copies are still protected, it just makes exact
duplicates.

Please let me know if you are still interested!

58. Software Titles HELP! (info)

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-06 01:34:27 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJ6ppG.FHG@utnetw.utoledo.edu>
Source record: 103539

I am currently planning on buying some "new" software from American Techna-Vision, BUT I need some quick reviews! If anyone out there has seen or played these games or used these packages, PLEASE respond (a followup to this post is fine, it'll get some play strategy comments and software chatter, etc. going again!)

Atari:
Battlezone (cart) - $12.50 - is it a respectable adaption of the arcade?

Red Rat Software:
Technicolor Dream (disk) - $4.95 - 256 color drawing/printing program. (Epson printers only? Easy to use? Can it load any other format?)
(The old catalog I have actually reads $4.95... must be a misprint - most likely corrected in the new catalog I fear!)

Mindscape:
Gauntlet (disk) - $12.50 - I've seen a cracked version of this, but it looked pretty sorry if you ask me. Hard to see anything... must be insane to play it!?!

Adventure International:
Adventures of Buckaroo Banzai (disk) - $12.50 - is this a graphical adventure? Decent Infocom-like vocabulary/parsing interface?

Datasoft:
Theatre Europe (disk) - $12.50 - war simulation stategy game - decent graphics? I've played only a couple Datasoft games, and they seem renouned for their graphical interfaces! How's their strategy interpretation???
Bismarck (disk) - $9.95 - North Sea chase - be the Bismarck or the Royal Navy - it says real-time action... sounded originally like a longer-term game... is it similar to Silent Service?
* Tomahawk (disk) - $12.50 - I MUST HAVE INFO ON THIS - SOUNDS EXCELLENT! 3-d state-of-the-art (circa 1986 or so) helicopter simulation. A full-fledged day and night combat simulator of a AH-64A Apache... multiple missions... hmmmmm. Looks like one of their last products before the company closed shop!
Zorro (disk) - $9.95 - screen to screen combat, sounds an awful lot like Bruce Lee - anyone know if it is? If so, heck it's definitely worth ten bucks!

Electronic Arts:
Racing Destruction Set (disk) - $9.95 - customize your vehicle to survive racing the course and to survive the other players! Split screen for two players. Cars/bikes/etc. Sounds intriguing, but as I recall, was very poorly written or something. Didn't play too

well?? It's selling for $9.95, doesn't sound like much, but I was hoping to order a couple of other titles... even some not mentioned here in this list (such as Scott Adams adventures and another copy of Alternate Reality the Dungeon... plus I/O cables (3 for $10) - I can always use spare cables. Another $10 might hurt, A LOT!

Newell:
FASTCHIP - $15.50 - ok, it's not software, but... - replacement floating point ROM package for the 800 or 400. Up to 3 1/2 times faster. Umm... sounds like something everyone should have. Does ANYONE have it? Does it overpower the typical arcade-style games though? Is it toggleable on/off for times you definitely don't want it (games)? Any known big incompatibilities? This sounds weird, but I CAN'T FIND IT IN THE LATEST MAILING FROM NEWELL! Was it discontinued? Does it only work as PART of an OS upgrade? As I've said previously, I've asked a few questions when calling Newell's number (not toll-free BTW), but they never seem to know what it is they're selling. I need someone I can refer to DIRECTLY for help with their products.

A N Y O N E ???

-Tim

PS: ok, ok, before I get flooded with requests again, the name and address:
American Techna-Vision
15338 Inverness St.
San Leandro, CA 94579 (U.S.A.)
Customer Service or Info # 1-510-352-3787
(Whoever maintains the vendor FAQ, PLEASE append this poor vendor to the list - they've only specialized in Atari 8-bit stuff for, oh, 15 years now... they've actually been around since 1973... scary thought, eh? What all was around back then computer-wise? Commodore PET's, HeathKit, hmm... IBM PC?)

PPS: Yes, they have a 1-800 number for orders ONLY also... they really can't answer many questions on this line though except in regards to their current inventory (whether or not the item is in stock).

Well it all depends on what version you saw. The first crack version of this to come out was from US_GOLD and was out and floating about for atleast 15 months before Mindscape ever came into the picture for the United States Distribution. The PAL version flickered alot and crashed a little while after 2 people were playing at the same time on NTSC systems. The Mindscape NTSC version has the same graphics but the flickering is not there and you can play with 2 players w/o crashing.

> before the company closed shop!

From what I remember, this was a pretty hot simulator for its time and for the 8bit. I'm not much into simulators, but this was the best helicoptor simulator I've seen yet for the 8bit.

> Zorro (disk) - $9.95 - screen to screen combat, sounds an awful lot like
> Bruce Lee - anyone know if it is? If so, heck it's definitely worth

The Zorro I remembered was from DataSoft (?) and was a sort of puzzle solving game. You do fight some bad guys, but its mostly getting this object from here and placing it there. Graphics are of simular tastes to Goonies or Bruce Lee.

Hope this helps,
BRiT (clisowsk@mcs.kent.edu)

I got this from them some time ago, before the price was raised from $4.95 to $10 (now cut in half for their 1/2 off sale :^). It appeared to be written for PAL systems, but works fine on a US NTSC system. Their 256-color mode is identical to APAC, and so may not work on certain monitors (you'll still get pale colors). It may have been able to load some other formats, but uses their own custom DOS (groan) to save files (they do give you some code to let you load their files). The drawing program isn't particularly powerful, but does have some unique features (brighten/darken entire picture with a single command). I didn't try their printing routines.

I apologize to the vendor if I am misquoting its capabilities, as I am recalling this from memory. It has been sitting on my shelf gathering dust for a few years...

Hi, I'm trying to remember the name of the 8bit game that had one or two players running around on a 3d board, avoiding zombies and dropping crosses to block them. If you were playing two-player, one player could resurect his dead buddy by touching him, which gave him 5 hit points.

It had seven levels, I think, like "Hades" and "Gen(mumble)" (different levels of hell?) (Gates of Hell? Was that the name??)

Thanks for helping me remember. If anyone knows where to find a copy, let me know. :-)

-Kurt Hockenbury

From what I could tell via the software drivers, I think the Atari SX212
modem basically was a standard 1200 bps modem with a R:Verter added to
the circuit board. I'm thinking the drivers for it were either identical
to the R:Verter drivers, or a simple modification from them.

THAT was the name: Realm of Impossibility! Thanks!

I recall seeing an interview with the author, who said that the whole thing started off as a football game he was writing, but then he added these zombies...

Thanks again. I'll have to dust off my disks and see if I still have a copy that loads.

Ah-ha! This could help! Nope... saw the list a while ago, and I ACTUALLY have the FAQ saved in my account somewhere, but I haven't seen the Vendor file since about Sept. or Oct. We had a few scattered down times for our NNTP server... ended up dedicating a new machine for that... WOW - FAST!

Thanks for the review comments, too!

-Tim

PS: Could someone please post the latest Vendor Faq/list or email it to me?

Just wanted to post a quick "thank you" to all who have commented on the games/products list thus far! I do appreciate this! I'm surprised to here someone out there has Technicolor Dream!!! Now I know I'll be picking this up - how long is this "half off" sale going on? I think I'll be calling them today or tomorrow anyhow...

-Tim

PS: kudos to British also... now I know it wasn't just me with the Gauntlet 2-player mode crash problem!!! I could move a bit, then suddenly, lockup! Lots of flicker too... (lockup - 2 player mode, flicker - both 1 and 2 player)

[...]

Are you sure it's the RS232 (serial) interface? That's a little rare
for the dot matrix printer. If it is serial, you talk to that one as
R: (or maybe R2:).

>real drives). By the same token, you are not limited to addressing the
>printer as P:, although that always works as long as you only have one
>printer connected. I found with some experimentation that I could have
>my regular printer AND my 1020 connected to my 8-bit, and just addressed
>them by the number that was apparently built in. For instance, the 1020
>can be addressed as P4:. Experiment and see if this helps.

I found that parallel interfaces usually respond as P2:. Also, the
old 820 (?) thermal printer didn't respond to anything but P:. I
don't know if that was the only one limited that way, or if it was
common to others of the era.

If this approach is workable for you, you do need to be aware of
programs that only address P: -- they can cause problems.

74. Color monitor for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-06 22:40:28 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <00978243.968AAF40@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103556

For sale-

BMC color monitor, 13", composite video + audio via RCA jacks (industry standard). Excellent picture and sound.

Asking $85 or make reasonable offer.

Also for sale-

BMC green monochrome monitor, 10" or 11" (not sure exactly), composite video input via RCA jack, no audio. Excellent for text-intensive applications such as word processing, data base, spreadsheet, BBS'ing etc. Resolution on a monochrome monitor is MANY MANY times better than a TV!
Asking- best offer, prefer more that $30.

Thanks!

75. 5.25" 720K (quad density) drives for sale

I remember this game - pretty good for the time. I also remember it being too hard for me at the time so I used the trusty David Young sector editor to changethe "life points" or whatever they were called - made it easier, of course I guess it took some of the fun out of it since I was able to complete all of the levels. Anyway look into it if you're still playing it.

Message-ID: <CJ8vz0.L6o@utnetw.utoledo.edu>
Source record: 103562

Finally managed to get a .txt copy of this darn thing... seems unix doesn't generally have an "arc" program pre-installed! (argh)

You've heard of it! You've seen excerpts from it! But, if you're like me, you may have never had a chance to get a FULL copy of the VENDOR FAQ... <everyone bows>... that is, until NOW! I saved a post of it from this newsgroup months ago, but it was apparently cutoff near the last couple pages (I've seen this more often with uuencoded binaries than text files). It's been ages since we've had a sighting here (October), though we did have a smattering of down time in Dec.). I made reference to it a couple times in the last two weeks as did another... wish I would've had a copy then, I would've fixed it and posted. I had hoped ANYONE would post it... patiently waiting, all I'd get are things like yup, yup, I've got it right here - A.T.V.'s been in the listing since it began, uhuh. But never the long-awaited post. I figured enough's enough and painstakingly grabbed the .arc version, transferred it, un-arc'd and sent it. My next mission: run archie to find a good version of arc for this darn unix monster. (I can't believe arc isn't supported!!! the sysadm installed unzip even, but no ARC!!!) BTW: I still love unix tho. Any Atari versions of Unix? :) (I think I'll hide before the rocks hit me.)

A quickie question: I can ymodem-u/l fine with Bobterm ver 1.20 (I have ver. 1.21 stashed here somewhere too... NOTE: 1.21 not on the archive), but I have been unable to d/l with it! Any ideas? I have to soft-boot, load another package, receive via kermit (shudder...sputter...wheeze), then go back. We use the simple (sx/rx, sb/rb, sz/rz for send/receive xmodem, ymodem, and zmodem respectively) on our mainframe - has anyone else had trouble with ymodem and mainframe file transfers?

One last warning: the list is fairly complete BUT many of the vendors listed are defunct as of several years ago. I remember someone posting that a "Michael Current" keeping a current (no pun intended), updated list. Does anyone have his email address? Anyhow, thanks to Ben Poehland for the original!

-Tim

That is a possible solution. I remember reading somewhere that all of Atari's printers had a secondary id that was unique. This article even listed the secondary ID's. The trouble is that I can't remember where I read it! <ARGH!> The 820 may have been designed before they decided to do that sec. ID stuff.

Hmm, the P:R: Connection manual doesn't mention a secondary ID. Maybe someone else can shed some light on this...

Funny you should ask that. I have had problems with x-modem in its many flavors on our VAX/VMS system and another Ultrix system I use. On the VAX, our X-Modem program seems to truncate files when downloading. On a 20k file, I will get 8k, and the X-Modem program will end "successfully" as if it has transferred the entire file. I had this problem with an 8-bit (BobTerm) and an ST (Flash). Kermit-65 (8-bit) gave me no problems, and Z-Modem on my ST gives me no problems. I just tried X and Y-modem on the Ultrix system last week with an Apple //c. With X-modem, the transfer would get a couple of k (no more than 6 or so) and then just time out. With Y-Modem, I could get a little more (16k max), but same situation. I was only able to get one file successfully with that setup (a 9k file). Finally what I did was used Z-Modem on my ST to d/l a Kermit program for the Apple // and then null-modem it to the Apple (X-Modem worked fine between the ST and Apple!). I don't know what the problem with the X/Y-Modem programs on the mainframe are.

Does anyone know the whereabouts of the game Elite for the 8-bit Atari?

As far as I know it was never released officially but I met someone from
Atari UK at a show a few years back and he confirmed (strictly off the record)
that it did exist as he had seen a bootleg copy.

Apparently the game is excellent, better than the Acorn original.

Any help much appreciated.

Thanks.

Graham.

RICOCHET. I did the Apple II version of it. Weird game, but kind of fun.
The best version, however, was the HP150 version, since the HP150 had that
built-in touchscreen. Just tap the screen where you wanted to change
a bumper - K00L.

Unreliable in what way?

My first modem was connected to my 600XL using an R-Verter, and worked
reliably for a couple years (still works, as a matter of fact, although
I don't use it regularly anymore).

86. Locatable Basic?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-07 16:51:41 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1994Jan7.165141.79907@austin.onu.edu>
Source record: 103567

Is there any way to make a BASIC program re-locatable? If there is, does anyone have any ideas on the following? I would like to make a small basic script that would act as a screen saver. I already have the script ready, but I don't know if it is possible to make a TSR (terminate and stay resident) program on the Atari.
I would like to have my program kick in rather than the built in 'attract' mode.

Thanks

A friend of mine has a 130XE with Atari Dos 2.5 (maybe 2.0) and AtariWriter+ with 5 1/4" floppies containing info. I am not familiar with the machine and have not even tried it myself (since we are a fair distance away).

Can these disks be read by a PC? My friend wants to move the files to a PC to finish working them. Is there an AtariWriter+ to WordPerfect filter or something similar?

I would appreciate any help you can give me. Thanks.

PS. Is there anything like AtariWriter+ for the PC under Windows or DOS? My friend really like AtariWriter+.

PC's cannot read DOS 2 or DOS 2.5 disks. PC's can read double density
MYDOS disks which your friend probable cannot write. (The standard
ATARI disk drive needs to be modified to do this). If he has a disk
drive that can write double density, then get a copy of MYDOS on the
Atari, and UTIL for the PC. The docs you need are included with UTIL.

If you cannot do disk transfers, try using a modem.

The best way to transfer files, is to print then using Atariwriter to a
disk file. Use a really stupid printer which cannot handle any escape
codes, and the result is formatted ASCII. This can then be read into
the PC with no problems.

I actually determined what I said above by testing the Xetec Graphics
AT and the P:R: Connection. I suppose two samples may not be enough
to say "usually", but I can say that those two both responded as P2:,
and since the P:R: was a close copy of the 850, I would guess that the
850 responded as P2: as well.

That sounds correct. All external interfaces designed to Atari's standards should respond to the primary id of P: or P1: and the secondary id of P2:. What I can't seen to find is the list of secondary id's for Atari direct connect printers. They each had a unique secondary id from what I remember reading.

Some Atari guru might prove me wrong, and I hate to be a pessimist, but I don't think this is possible, especially in BASIC. I'll leave it to someone else to explain why not in BASIC (I can't thinkof a good way to explain it), but I have looked into doing it in assembly. I wanted to use the "Stars 3D" program from ANALOG #16 as a screen saver.

Assembly would allow a sort of "TSR" routine using vertical blank interrupts, but the attract mode seems to be designed deeply into the OS, not as an add-on. My memory on it is a little fuzzy, but I do remember that it looked difficult to put my own routine in. It could probably still be done, but I don't think it could be much more complicated than what's there - flipping screen colors periodically.

And I am certain it can't be done as a pure BASIC routine. Maybe a BASIC loader for the ML routine, though.

Somebody else already mentioned the disk solution. You can also use a
null modem cable (or modem over phone lines, of course).

I think I saw something somewhere recently about a macro for
WordPerfect to translate AtariWriter files. I think it was in Atari
Classics.

>PS. Is there anything like AtariWriter+ for the PC under Windows or DOS?
> My friend really like AtariWriter+.
No- most of the PC word processors are better. (Yes, I have moved to
a PC for word processing.)
You could probably set up WordPerfect to use equivalents of
Atariwriter+ keystrokes, but I'm not sure if versions earlier than 5.2
can do this. For a look slightly closer to Atariwriter in
WordPerfect, tell it not to hide codes.
I prefer Lotus Ami Pro (for Windows), but that's a bit off-topic.

I think there was a program around a while ago that would
multitask BASIC by swapping stuff in and out of expanded
memory. You could probably do the same sort of thing but
simpler for your screen saver.

Message-ID: <758133733.AA04757@rochgte.fidonet.org>
Source record: 103597

I Could use them. Ive got an ATR8000 and 2 Tandon drives. Only one of them is 360K but I seem to be getting some bad sectors on the disks I write to in it. It dos'nt always happen but once in awhile I find some program on a disk that i've recently been writting to haveing a bad sector. I this the drive? Should I be waiting for the drive LED to turn off? I dont mean I take disks out while its reading or writing but, like Atari drives, the motor has got to keep spinning for two seconds afterward. I dont know why. Apple drives dont do that. Another odd thing is both drive motors spin when im only using one. Could I have the jumpers set wrong?
Seeing that im talking about computer problems, consider this message to all. If anyone knows whats going on, tell me.
Ok, as for the drives your selling, I do want to try getting at least one more 360K but id rather not mail in for it. Too much hassle. then again since I dont have a car to go anywhere, Its just as much trouble trying to buy one locally. how 'bout $10 for a drive and S/H?
I mean the shipping & handling would come out of the $10.

For sale-

BMC color monitor, 13", composite video + audio via RCA jacks (industry
standard). Excellent picture and sound.

Asking $85 or make reasonable offer.

Also for sale-

BMC green monochrome monitor, 10" or 11" (not sure exactly), composite video
input via RCA jack, no audio. Excellent for text-intensive applications
such as word processing, data base, spreadsheet, BBS'ing etc. Resolution
on a monochrome monitor is MANY MANY times better than a TV!
Asking- best offer, prefer more that $30.

Thanks!

I don't think this would be possible in pure BASIC - you'll need at
least a routine (in assembler) to look every 1/50 second if the atract
mode is switched on (i.e. Peek(77) > 127). But a screen-saver
shouldn't stop the normal program... try with assembler, it's much
easier as you think!

As far as ARC goes, you can get the C sources via ftp... just do and Archie
arc. Also, the last version of xmodem/ymodem for unix, prior to the release
of SZ/RZ, supports a good ymodem that works well with Bobterm. Again, you
can ftp the C sources and compile 'em in your own directory...that's what I
had to do to get Arc, Ymodem, Zmodem, and UQwk support...

l >Is there any way to make a BASIC program re-locatable? If there is,
l >does anyone have any ideas on the following? I would like to make
l >a small basic script that would act as a screen saver. I already

A while ago, I'd written a small program in Mac/65 that loaded itself into page 5 as I recall and used one of the VBI's to monitor ATRACT ($4D). When ATRACT reached some value (not enough to set off the OS's attract mode) it would reset ATRACT, turn off DMA, and wait for a key press. True, it wasn't much to look at, but it did work. I'll have to go through my old disk and see if I can dig it up.

I really don't think it'll be possible to do as just basic code unless you're using basic to install the ML code...or maybe compiled basic... something like the MMG or ABC basic compiler might work if you can find one. You might also think of Action!, new Action! carts should be out in March...

Mike

From what you've said about the system, the best bet would be to build or
acquire a null modem cable and use your fav. telecom program to transfer
the files. There is a program that I've used that was written by
Marek Tomczyk in Germany called "Show.exe" that does a great job of converting
ATASCII files to ASCII, Show runs on MsDos machines, not 8bits. You may want
to look into getting this program, though, using the null modem method you
shouldn't have any troubles with ATASCII/ASCII conversions.

I'd not thought of using that program, though, finding a place for screen memory might be a bit of a pain...I wouldn't want to lose anything I was working on at the time. I'll have to get that issue and take a look at the source...could be real interesting.

Not correct... I had captured an old Vendor FAQ posted here and checked the
whole thing a couple months back. American Techna-Vision wasn't there. Odd,
maybe it was a cutoff post? I've seen that happen more with uuencoded binaries
tho... weird.

Ever wonder why so many users kept asking on this group why it wasn't in the
vendor FAQ when I'd reference it in my msgs? Sigh... makes me wonder if
anyone actually reads their posts in this group after they send 'em.

I have run "SX -OK" and "RX -C" from the SZ/RZ package of UNIX
X/Y/ZMODEM and have never had a problem using it with Bobterm. (Of
course, I never had a seven-bit data path or an EBCDIC mainframe to
contend with....) It seems to emulate XMODEM-1K packets just fine.

Of course, there's always "the old standby", T:EDIT; this will convert
ATASCII--->ASCII and vice versa, and also strips ATASCII's carriage
returns as an option. I use this sometimes if I save a text file that I
may have D/Led from, say, an Internet host; I will convert it to ATASCII
and reformat the output to 40 columns.

That is a possible solution. I remember reading somewhere that all of Atari's
printers had a secondary id that was unique. This article even listed the
secondary ID's. The trouble is that I can't remember where I read it! <ARGH!>
The 820 may have been designed before they decided to do that sec. ID stuff.

Hmm, the P:R: Connection manual doesn't mention a secondary ID. Maybe someone
else can shed some light on this...

Finally managed to get a .txt copy of this darn thing... seems unix doesn't
generally have an "arc" program pre-installed! (argh)

You've heard of it! You've seen excerpts from it! But, if you're like me,
you may have never had a chance to get a FULL copy of the VENDOR FAQ...
<everyone bows>... that is, until NOW! I saved a post of it from this
newsgroup months ago, but it was apparently cutoff near the last couple pages
(I've seen this more often with uuencoded binaries than text files). It's
been ages since we've had a sighting here (October), though we did have a
smattering of down time in Dec.). I made reference to it a couple times in
the last two weeks as did another... wish I would've had a copy then, I
would've fixed it and posted. I had hoped ANYONE would post it... patiently
waiting, all I'd get are things like yup, yup, I've got it right here -
A.T.V.'s
been in the listing since it began, uhuh. But never the long-awaited post. I
figured enough's enough and painstakingly grabbed the .arc version, transferred
it, un-arc'd and sent it. My next mission: run archie to find a good version
of arc for this darn unix monster. (I can't believe arc isn't supported!!!
the sysadm installed unzip even, but no ARC!!!) BTW: I still love unix tho.
Any Atari versions of Unix? :) (I think I'll hide before the rocks hit me.)

A quickie question: I can ymodem-u/l fine with Bobterm ver 1.20 (I have ver.
1.21 stashed here somewhere too... NOTE: 1.21 not on the archive), but I have
been unable to d/l with it! Any ideas? I have to soft-boot, load another
package, receive via kermit (shudder...sputter...wheeze), then go back. We
use the simple (sx/rx, sb/rb, sz/rz for send/receive xmodem, ymodem, and
zmodem respectively) on our mainframe - has anyone else had trouble with
ymodem and mainframe file transfers?

One last warning: the list is fairly complete BUT many of the vendors
listed are defunct as of several years ago. I remember someone posting that
a "Michael Current" keeping a current (no pun intended), updated list. Does
anyone have his email address? Anyhow, thanks to Ben Poehland for the

original!

Funny you should ask that. I have had problems with x-modem in its many
flavors on our VAX/VMS system and another Ultrix system I use. On the VAX, our
X-Modem program seems to truncate files when downloading. On a 20k file, I
will get 8k, and the X-Modem program will end "successfully" as if it has
transferred the entire file. I had this problem with an 8-bit (BobTerm) and an
ST (Flash). Kermit-65 (8-bit) gave me no problems, and Z-Modem on my ST gives
me no problems. I just tried X and Y-modem on the Ultrix system last week with
an Apple //c. With X-modem, the transfer would get a couple of k (no more than
6 or so) and then just time out. With Y-Modem, I could get a little more (16k
max), but same situation. I was only able to get one file successfully with
that setup (a 9k file). Finally what I did was used Z-Modem on my ST to d/l a
Kermit program for the Apple // and then null-modem it to the Apple (X-Modem
worked fine between the ST and Apple!). I don't know what the problem with the
X/Y-Modem programs on the mainframe are.

Does anyone know the whereabouts of the game Elite for the 8-bit Atari?

As far as I know it was never released officially but I met someone from
Atari UK at a show a few years back and he confirmed (strictly off the record)
that it did exist as he had seen a bootleg copy.

Apparently the game is excellent, better than the Acorn original.

Any help much appreciated.

Thanks.

Graham.

RICOCHET. I did the Apple II version of it. Weird game, but kind of fun.
The best version, however, was the HP150 version, since the HP150 had that
built-in touchscreen. Just tap the screen where you wanted to change
a bumper - K00L.

Shouldn't be hard to replace the attract mode.... all that does is check
a timing register and run a ML routine.... all you would have to do (if
the routine is short enough to run in the vertical blank with the OS) is
check the clock register yourself... and just before the OS would do
something, do your stuff and reset the clock... then jump on to the
current VBI routines (thus the register gets reset before the OS tries to
do attract mode)... if you want something that cannot be put in the VBI
interval, be careful in writing it as a simple interrupt... but it could
just poke some flag register, and if your basic routine is running in a
loop, you can have (in the loop) IF PEEK(FLAG)=FLAVALUE THEN GOSUB
ATTRACTBASIC

Unreliable in what way?

My first modem was connected to my 600XL using an R-Verter, and worked
reliably for a couple years (still works, as a matter of fact, although
I don't use it regularly anymore).

Is there any way to make a BASIC program re-locatable? If there is,
does anyone have any ideas on the following? I would like to make
a small basic script that would act as a screen saver. I already
have the script ready, but I don't know if it is possible to make a
TSR (terminate and stay resident) program on the Atari.
I would like to have my program kick in rather than the built in
'attract' mode.

Thanks

A friend of mine has a 130XE with Atari Dos 2.5 (maybe 2.0) and AtariWriter+
with 5 1/4" floppies containing info. I am not familiar with the machine and
have not even tried it myself (since we are a fair distance away).

Can these disks be read by a PC? My friend wants to move the files to a PC
to finish working them. Is there an AtariWriter+ to WordPerfect filter or
something similar?

I would appreciate any help you can give me. Thanks.

PS. Is there anything like AtariWriter+ for the PC under Windows or DOS?
My friend really like AtariWriter+.

I posted this just over a week ago... since then I have heard from Philip
and had quite a few good comments on it... at least one mentioning I should
repost again after the holidays, SOooo:

(Any comments? Anyone see the code reputed to be on "the archive"??? Etc.)

- -

Subject: DATASOFT -=> Alternate Reality
Newsgroups: comp.sys.atari.8bit
Summary:
Keywords:

I was just over a friend's place as he was playing Blakestone, another of
Apogee's newest releases for the IBM-compatible world, and started thinking...
these guys really have the 3-d perspective engine running quite well, with the
new release of Doom1.1 and Blakestone and all... hmm, I recall Datasoft and
Philip Price kind of pioneering that work back in the heyday of Alternate
Reality, Mercenary, Wayout, etc... wonder if ID/Apogee would be interested in
a new twist to their shoot-em-all-till-everything's-dead-hahaha-games and try
to resurrect not just the old Alternate Reality: The City and Dungeon for the
PC, but to actually bring back to life the old FULL idea of the game...
6 main sections starting with the City, branches to the Dungeon, Wilderness,
Palace, Arena, and the "final confrontation/escape home". They've released
6-parters before: Keen and Wolfenstein for instance... they could release a
WEAK demo of the City version for sharware... they have the 3-d view already
working perfectly... some old work WAS already done for the IBM PC versions
by Datasoft YEARS ago on the City and the Dungeon...

Anyone know how to contact ANYONE from the defunct Datasoft company?
Anyone know Philip Price? Gary Gilbertson did most of the musical composition
for the work if I recall correctly. How about good old Gary? I believe I can
make a strong sell to the guys at ID/Apogee, in fact, I think I went to school
with one of the main programmers a few years back (college). I assume they'd
have to get the rights from Philip Price since Datasoft's long gone... he'd be
my best contact. Also, he had the entire story-line laid out... specifics, no,
but concept, a BIG yes!

Heck even with 320x200 graphics, it would look wonderful... the Atari version
used a full 128 color palette, could switch EASILY to 256 color VGA on an IBM
compatible... would work even on the old 256k VGA cards! A sound card would be
mandatory... well, maybe not. But sounds WERE VERY IMPORTANT to game play,
remember trying to triangulate a smithy's banging off hidden corridors?
Some sounds announced the amount of "EVIL" in your foe. Other sounds were
just entertaining: walking near the arena, you could hear the fighting; by the
palace, the "royal serenades"; the lightning and rains out in the open areas of

the city. Man, that game had some really nice touches to it! The rising and setting sun, weird multi-color pools after toasting a baby dragon, etc. AS LONG AS THEY KEPT TO THE ORIGINAL GAME CONCEPT, little combat menus, banks, inns, taverns, guilds... wow, what a progressive step for ID/Apogee to make! They have some phenominal shoot-em-up combat games, this would add more of a real-life or thinking aspect in one of their games... it'd throw most of their followers for a loop! I'd pressure all the people I know that had the old 8-bit Atari's to register for an IBM ID/Apogee release of it!!! I'm sure it'd make some profits for them! Heck, Philip Price might even agree to work on it with them!??!??!

ID/Apogee's typical games last 20 minutes to a couple hours start-to-finish, even full-length registered versions. This was more of a several day, 24 hour straight type of venture... you could keep going MUCH longer if you wanted. This game had a couple tricky puzzles, but more of a "building" game... you just don't start out with a mega-powerful character and go through the maze-like streets (sewers for the dungeon) blasting everything you encounter. Had a huge randomness factor I liked too! Some stats kept on your character could be seen, many more were kept as the computer/game monitored your character play and adjusted encounters accordingly... nice touch! I know this might sound more in the line of an established strategy/RPG company such as Origin, SSI, or the like, but with their continued good showing in the 3-d viewport arena and their proven soundcard support in the games, ID/Apogee may be the best place to start my quest! I figure they'd love a chance to expand their field of expertise into a new realm. The City could be a trial run, with the Dungeon being worked on at the time of release... if it goes well and they get a lot of positive feedback (and registrations), I bet they'd go for it! As long as it's not a rush job on the 4 unfinished parts (are they? Philip Price thought a LOT of this out in advance, I wonder...), I'd bet it would make a dent into the big RPG market!

Any leads would be appreciated! I don't know why this urge to see this game played around the globe again has come over me... maybe that's just it. I remember years back when most people in the city were working together to get through the game... Atari, Commodore, Apple, IBM PC and PCjr... weird... maybe I just need more sleep. But I AM serious about trying to acquire some info on the author and the company. Can I make a difference? Can I help bring that time-killer Alternate Reality back from the grave? Who knows! But I'm certainly going to give it one heck of a try!!!!!

-Tim
(timuszyn@jupiter.cse.utoledo.edu)

PS: I have the following outdated info already:
Datasoft (also IntelliCreations, Inc.)
19808 Nordhoff Place
Chatsworth, CA 91311-9969
(818-886-5922)
Author: Philip Price, Music: Gary Gilbertson
(work by Paradise Programming, Inc.)
Guidebook: Kathi B. Tremblay

Also, the Dungeon weilds a load of names:
Programmed by: Dan Pinal, Ken Jordan, Jim Ratcliff, Rick Mirsky
Original concept by: Philip Price
Music composed by: Gary Gilbertson
Graphical art by: Benita Long-Hemsath, Steve Hofmann

(for all the good it'll do me)

PC's cannot read DOS 2 or DOS 2.5 disks. PC's can read double density
MYDOS disks which your friend probable cannot write. (The standard
ATARI disk drive needs to be modified to do this). If he has a disk
drive that can write double density, then get a copy of MYDOS on the
Atari, and UTIL for the PC. The docs you need are included with UTIL.

If you cannot do disk transfers, try using a modem.

The best way to transfer files, is to print then using Atariwriter to a
disk file. Use a really stupid printer which cannot handle any escape
codes, and the result is formatted ASCII. This can then be read into
the PC with no problems.

125. Asked for a maze game, found the name...

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-09 02:34:32 UTC
From: demoydk@iitmax.iit.edu
Message-ID: <1994Jan9.023432.2265@iitmax.iit.edu>
Source record: 103589

Hi again! A while ago, I asked if anyone knew a game that was basically a maze, but had enemies, shifting walls, and was only on tape media (at least that's the format I saw it in).

I bought some old disks (originals, and from a potpourri (?sp) bag at a garage sale), and there it is...Labrynth! It was for the Apple][computers, but at the program's release date, it was ported for other computers like Atari.

Does this ring a bell? If so, I just want to know if its obtainable via Freeware, "I buy from your originals," or if its unobtainable.

Anyways, this game is NOT the same as any Pac-Man variants, Jawbreaker, or the other game from Sierra On-line (you shoot enemies to go to the next level).

In any case, drop a line...

Thanks for the inspiration and advise!

Yung Kim

I actually determined what I said above by testing the Xetec Graphics
AT and the P:R: Connection. I suppose two samples may not be enough
to say "usually", but I can say that those two both responded as P2:,
and since the P:R: was a close copy of the 850, I would guess that the
850 responded as P2: as well.

Some Atari guru might prove me wrong, and I hate to be a pessimist,
but I don't think this is possible, especially in BASIC. I'll leave
it to someone else to explain why not in BASIC (I can't thinkof a good
way to explain it), but I have looked into doing it in assembly.
I wanted to use the "Stars 3D" program from ANALOG #16 as a screen
saver.

Assembly would allow a sort of "TSR" routine using vertical blank
interrupts, but the attract mode seems to be designed deeply into the
OS, not as an add-on. My memory on it is a little fuzzy, but I do
remember that it looked difficult to put my own routine in. It could
probably still be done, but I don't think it could be much more
complicated than what's there - flipping screen colors periodically.

And I am certain it can't be done as a pure BASIC routine. Maybe a
BASIC loader for the ML routine, though.

>850 responded as P2: as well.

That sounds correct. All external interfaces designed to Atari's standards
should respond to the primary id of P: or P1: and the secondary id of P2:.
What I can't seen to find is the list of secondary id's for Atari direct
connect printers. They each had a unique secondary id from what I remember
reading.

Somebody else already mentioned the disk solution. You can also use a
null modem cable (or modem over phone lines, of course).

I think I saw something somewhere recently about a macro for
WordPerfect to translate AtariWriter files. I think it was in Atari
Classics.

>PS. Is there anything like AtariWriter+ for the PC under Windows or DOS?
> My friend really like AtariWriter+.
No- most of the PC word processors are better. (Yes, I have moved to
a PC for word processing.)
You could probably set up WordPerfect to use equivalents of
Atariwriter+ keystrokes, but I'm not sure if versions earlier than 5.2
can do this. For a look slightly closer to Atariwriter in
WordPerfect, tell it not to hide codes.
I prefer Lotus Ami Pro (for Windows), but that's a bit off-topic.

I think there was a program around a while ago that would
multitask BASIC by swapping stuff in and out of expanded
memory. You could probably do the same sort of thing but
simpler for your screen saver.

This is true, there is also TextPro. Still, if you've just null modemed
several arc packets of text files to your IBM, Show.exe makes short work
of converting the files.

134. Re: DATASOFT -=> Alternate Reality

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-09 06:56:57 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJCoMy.7s3@utnetw.utoledo.edu>
Source record: 103593

I was answering a few questions for one valiant adventurer in Alternate Reality overseas and thought I'd post a clipping from my reply. Yes, I tend to get long-winded sometimes... on this topic though, I'd love to hear more from the rest of you as well!!! Any Potion Lists out there for instance? Sample maps (probably not ascii since the detail would be too great, maybe split into quadrants though)? ???

- -

Wow, can't quite reach your site by normal means... hope email gets through!

Well, I haven't REALLY played Alternate Reality: The City (for SEVERAL hours on end) in years now, but I do remember most of it. Some game... wow. Anyhow, I've got some good news and some bad news:

1. Jobs in the city? Well, supposedly when the Palace came out, you could get a job doing various tasks in and about the city and palace... Datasoft's been out of business for some years now so no further "modules" will be released. They did come out with the Dungeon, though.

2. Joining guilds... This is only possible in the City version for the Atari ST. I can join guild(s) in the 8-bit version of the Dungeon also!

3. Immortal? Huh? Hahaha...heh..humpf? You aren't serious, are you?

4. Magical weapons can only be found after battles. In the Dungeon, you can buy normal weapons from the weaponsmith and get them enchanted though!

5. Spells? Only by first joining a guild and becoming practiced in the arts... and as long as you have some power left in your guild ring!

6. Alternate Reality: the City and the Dungeon have been out of production for many years now. No other additions ever made production. The BEST place I can recommend to still buy NEW and UNOPENED versions of either episode is through American Techna-Vision here in the U.S. They have a good-sized catalog of NEW Atari 8-bit merchandise for low american prices. I don't know how the prices would translate for other countries though.
American Techna-Vision
15338 Inverness Street
San Leandro, California, U.S.A. 94579
"for technical info or to place an order from outside the U.S. phone:"
1-510-352-3787
"to reach regular store personnel, phone 7:30 am to 8:30 pm Pacific Time or 10:30 am to 11:30 pm Eastern Standard Time" (U.S. time zones)
They sell the City for $12.50 and the Dungeon for $12.50. Each are "stand-alone" versions. You can just start playing the Dungeon without first building your character up from the City.

7. A map of the city? Hmm... well, it's kind of rough. If you can post to the comp.sys.atari.8bit newsgroup, I'd ask around in there. Someone may have it all mapped out. (???)
- other hints... umm, stay near the floating gate when you first start out. A cheaper inn can be found by walking straight north MANY blocks - it'll be on the left as you approach the end of the long wall full of doors. I'm sure I had a general potion list somewhere, but seeing as I can't locate it, I've already asked in the atari group, but have had no replies yet. Not sure what else to tell you.

One more thing, the city and dungeon really didn't let you settle down and rest. The first few additions would just allow for further exploration, combat, new items, etc. The Arena was to be the ultimate battle proving grounds. When the Palace came out, it was to change the mood of the game a bit - you'd actually have a chance to own a tavern, work as a courier, or whatever... and watch the "newcomers" to the City battle it out, see the months go by, whatever. You could even buy your own "house" in the City! This would've been a big non-hostile addition to the game... maybe drawing in a larger following of game-playing types out there. I'd love to try it if it ever... oh-well. Not much hope of that now. (Unless, of course, I can talk Philip into briefing a new software production company on the specifics of the old and yet-to-come versions. Might be a legal contract with Datasoft still binding, but with their being bankrupt for SEVERAL years, I doubt they'd have any hold on the old products.)

-Cheers to great exploration!
-Tim

PS: The main Atari 8-bit archive for the world is at the ftp site:
atari.archive.umich.edu
log in as anonymous, give your email address, and you're in!
cd to atari for the general Atari area, then cd to 8bit for the 8-bit section!
As long as you can transfer by modem on your Atari, you'll have no problem getting access to a bunch of new (yes - some actually NEW) files and demos for the old Atari 8-bit computers!! All you need to do is ftp the files you'd like to try (binary mode on) to the system/mainframe you're using, then use kermit/xmodem/ymodem to transfer the file to your own Atari via modem. Can you FTP? If not, there's a way to get the files be email also. Do you have a Double Density Atari disk drive? You could write the files using a standard IBM computer to an Atari-format disk, then work with them at home.

Let me know what you decide!

: two different files used the same sectors!

Thanks for the input. This is a version of the same bug I've heard of.
You don't encounter it much unless you use a hard drive with large partitions
(and multiple sub-dirs of course).

From the incredible lack of response on this topic, I assume this really is
the only bug of MY-DOS! All right! I was worried a few more might pop-up
when I least expected, but sounds like I had nothing to fear! I wonder when
the new release will come out? (I'm expecting it around the time CSS and the
California software firm start selling the old ICD products in March) ???

I have the following excellent condition hardware for sale or trade:

(2) Atari 800xl (stock) w/power supply & one IO cable
(1) Atari 130xe (stock) w/power supply & one IO cable
(1) Atari 130xe (320k) w/Freezer switch, AC audio & video upgrades
(1) Atari 800xl (256k) w/Freezer switch, AC audio & video upgrades
(1) Indus GT disk drive
(1) Percomm data disk drive (green controller card, upgrade to 1.22mg)
(1) Okimate 10 color printer w/4 rolls paper & 4 ribbons
(1) Atari 1027 printer
(2) Color Composite Monitors (heavy duty, great color)
(1) SeaGate 20meg MFM (ST-225) half height hard drive (formatted on MIO)
(1) Atari TrakBall
(1) BEST TrakBall (switch between joystick or TrakBall mode)
(1) SpartaDos X cart w/docs
(1) Hayes V-Series v.42 9600 modem
(1) ADC 1200baud smartmodem

I will consider best offers on any listed items. I prefer trades though!

I seek:

Action! cart
Mac/65 cart
ComputerEyes
Happy 1050
US Doubled 1050
Printer buffer device (I have an MIO, but need something else also)
SIO2PC cable w/software (already built)
TransKey upgrade
OS ROM upgrades (all my machines, even those listed above are socketed)

Seems to me this "multiple printers at a time" question came up here a couple of years ago, and some one of the "old-timers" posted the new-to-me fact that, although all printers respond to I/O directed to device "P:", each model of Atari printer -- those which plugged directly into the SIO daisy-chain and passed the daisy-chain along -- would also uniquely respond to a device specification of "Pn:" where "n" is a number. A list of model numbers corresponding to "P1:", "P2:", "P3:" etc. was posted. The upshot was that if you were using Atari printers, you could connect several different models at the same time and select among them by what value of "n" you used in your OPEN command. Note that little if any commercial software ever made use of this capability; note also that it is not clear how an Atari 850 Interface Module :-) would respond to device specifications of type "Pn:" -- I suspect that a non-Atari printer connected to an 850 would always respond no matter WHAT value of "n" you used...

>Question about why I thought the R-Verter was unreliable for commercial
>applications.

We had some device failures in the field, but that in itself wasn't the
biggest problem.

The carrier detect function is only triggered on the rising edge of the
CD signal. This causes two big problems. It sometimes misses that pulse
edge, and thus doesn't know the carrier is present. It is also impossible
to tell whether a carrier has been dropped with that device.

I also really disliked the fact that the DTR signal would drop, which can
hang up the modem, whenever disk I/O needs to be done. You have to turn
off the device before you can do any other SIO accesses.

For what it's worth, X/Y/Zmodem file-transfer protocols require an 8-bit data path between computers; if you have only a 7-bit path, these protocols may not work. They also don't want flow-control, which tends to "eat" certain characters instead of passing them down the line, thus dropping them from the file. Kermit uses a "quoting" mechanism to send 8-bit data through a 7-bit data path. In its default form, Kermit is slower than X/Y/Zmodem because it uses a smaller packet size, but some of the newer incarnations of Kermit support a LONGER packet size that makes Kermit MORE efficient than X/Y/Zmodem. Unfortunately, I do not believe any of these new Kermit features have been ported to the Atari 8bit.

You guys' description of this LABYRINTH game sounds REEEEEEAL familiar. Tell me if THIS is the game you're talking about: you're INSIDE a 3D maze, not unlike "Wolfenstein 3D" on the PC, in structure anyway. You see walls coming at you as you walk around, and a map slowly forms at the bottom of the screen as you explore. There's a travelling enemy called "the Thief," which if it catches/touches you, STEALS your "mapper," so that the map DOESN'T continue to form as you travel, until YOU chase down and capture the Thief and steal the mapper BACK.

I know the above-described game as "WAY OUT," and I have it on my Atari.

Yep, in my original article I mentioned I can send fine, receiving is the problem. No flow-control, and definitely an 8-bit channel (of this I'm especially sure since send works beautifully). From what I'd heard, it may be some type of y-modem inconsistency between sb and Bobterm. Anyone recall if Amodem 8.0 supported y-modem? I've got to dig that poor old program out of retirement again it looks like!

: them from the file. Kermit uses a "quoting" mechanism to send 8-bit data

Well, actually, the Kermit program I have for my Atari DOES include the optional larger packet sizing, etc. And, unfortunately, KERMIT with longer packets still can't beat y-modem. Too much overhead. It's in the code routines, Kermit will always be slower (unless of course you send packets of ERROR-ATTRACTING-MEGA sizes - a 4-k packet might be asking for trouble!). Zmodem is pretty much your best bet all-around. I just wish we had a program on the Atari 8-bits which supported zmodem. Heck, I'd even settle for a standalone zmodem verson with a talk session, and VERY limited features!

Key words: ZMODEM, 8BIT - anyone tinkering around with a zmodem package for our oldtimers? I'd be willing to put a bit of $ towards an upgraded 80-column OMNITERM with ZMODEM capabilities!!! Anyone ever talk to the guy who produced the package? Sure, some of the features would have to be generic or ignored (no date or time stamps on files for non-Sparta users for instance)...

T >drives dont do that. Another odd thing is both drive motors spin when im onl
T >using one. Could I have the jumpers set wrong?
T > Seeing that im talking about computer problems, consider this message to

You shouldn't have both drive spinning when you access only one, check the
jumper settings...when I first hooked up my 2 360k disk, both would spin
at the same time when I'd call d1:, and I did have trouble with saves (both
drives were hard wired as d1...couple of new drives fixed the problem...)

its kinda nice to hook two high denz 5.25 up to you ATR and get 720k
per disk storage...only thing better is the BB/FB combo with a 3.5
1.44meg drive...

disconnect one of the drives hooked up to your ATR and see if you still
get errors on the disk.

Ya know, I recall doing this way back when I had a 1027 and 1025 hooked
up at the end of the chain...and you know, I can't remember the numbers.

Guess I'll just have to hook 'em up once again and try it a few times.

>respond to a device specification of "Pn:" where "n" is a number. A
>list of model numbers corresponding to "P1:", "P2:", "P3:" etc. was
>posted. The upshot was that if you were using Atari printers, you could

This is exactly what we were looking for (the model listing with numbers). P1:
is the same as P: BTW.

>that it is not clear how an Atari 850 Interface Module :-) would respond
>to device specifications of type "Pn:" -- I suspect that a non-Atari
>printer connected to an 850 would always respond no matter WHAT value
>of "n" you used...

The 850 and P:R: connection and any other compatible device used P2: as the
secondary ID. This leaves P3:-P8: for Atari SIO printers.

Anybody got the list of printers and secondary id's?

149. Atari 8-bit emulation for the PC (MSDOS or Unix?)

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-10 08:50:18 UTC
From: natasha@zwicky.unm.edu
Message-ID: <2gr4salNN1k0@lynx.unm.edu>
Source record: 103657

I currently have an AMD 486DX/40 with MSDOS 6.0 and Linux OS's.
And from my more memorable computing days an Atari 1050 disk drive with
lots of old programs. All of which are unusable since I traded in my
130XE for a PC.

I have recently heard that there is an atari 8bit emulator that can load
programs off the 1050 drive through the joystick port, for MSDOS.

Does anybody know where this can be found and/or purchased?
I also would like to know where a cable that would adapt an atari serial into
the joystick port could be found or how it could be made?

I remember hearing a couple of years ago that someone was writing an
atari emulator for Unix on the net; has anybody heard anything about this
lately?

I appreciate any comments and help! I have so far run into several dead-ends..

Thanks,
Marc Bluefire

150. Cribbage via TRANSDISK IV

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-10 10:30:40 UTC
From: dlg2@cck.coventry.ac.uk
Message-ID: <2graog$7tm@cc_sysk.coventry.ac.uk>
Source record: 103680

I have recently got a copy of TRANSDISK IV and would like to copy Cribbage from Thorn EMI onto disk. I have the original game which loads OK on a 400 but if you load it on a 130XE you must press reset halfway through loading. I suspect that it is something to do with a changed address or something with the different chips but I am not certain. This seems to be the main problem with loading. Can anyone help Please.

THANX

151. Using the joystick ports for data transfers..?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-10 11:02:28 UTC
From: Frank.Neumann@arbi.informatik.uni-oldenburg.de
Message-ID: <1994Jan10.111318.25361@arbi.Informatik.Uni-Oldenburg.DE>
Source record: 103681

Hi there,
I have this problem: I need to transfer some old files from my beloved 800XL to an Amiga (and also vice-versa - I believe there are some demos flying around on the net that I have not seen yet..). I suppose using the Atari's peripheral connector would be close to impossible - I don't know where I could get a connector plug nowadays, neither do I know any more how to program that thing. So I thought of the joystick port(s).
I have found out that on the Amiga it's possible to use pins 5 and 9 (usually those where paddle data is read in) can be used for reading and writing. I'm pretty sure this also works on the Atari, but my 'Mapping the Atari' is buried somewhere under a huge pile of paper, 200 km away from where I am right now. So I hope someone can tell me what bits of what registers I need to tweak to make the Atari write out bits on its joystick port.
Once this is clear, I think it would not be too hard to write a very simple data transfer protocol, using one bit as data and another as a 'data valid' indicator. I would then write the Amiga side's program in C, and the Atari program in something like TurboBasic XL (I forgot how to use Action! - it's too long ago :-).
Does this all sound reasonable ? Is it possible at all the way I want to ? Has anyone else already tried something like this before ? And what happens if on both machines the ports are set to either 'in' or 'out' ? So many questions..

If I should manage to get such programs written, I'd be willing to share them with the community.

Thanks in advance, and bye for now,
Frank

: l >does anyone have any ideas on the following? I would like to make
: l >a small basic script that would act as a screen saver. I already

: A while ago, I'd written a small program in Mac/65 that loaded itself
: into page 5 as I recall and used one of the VBI's to monitor
: ATRACT ($4D). When ATRACT reached some value (not enough to set off
: the OS's attract mode) it would reset ATRACT, turn off DMA, and
: wait for a key press. True, it wasn't much to look at, but it did work.
: I'll have to go through my old disk and see if I can dig it up.

Did your program still allow other programs to operate at the same time?
This is also a problem with using BASIC. Locating the value of PEEK(77)
was no problem, but implementing it is a bit harder.
One solution is this
2 IF PEEK(77)<>126 THEN 2
However, this means that no other programs can run at the same time.
With M/L it is probably possible to have the program only run at
VBLANKS and check location 77. Not possible with BASIC.

: I really don't think it'll be possible to do as just basic code unless
: you're using basic to install the ML code...or maybe compiled basic...
: something like the MMG or ABC basic compiler might work if you can
: find one. You might also think of Action!, new Action! carts should
: be out in March...

As I stated in an earlier message, the Atari 1020 responds to P4:. The
others may be easily established with a little experimentation. If you
have the printer, run the experiment; if you don't, it doesn't matter.

Message-ID: <2gs54r$774@fac1.cgrg.ohio-state.edu>
Source record: 103684

As the subject says...has anyone written one of these?
I remember Itay Chamiel used a custom high-speed scrolling display for his 'col80' file viewer.

Some time ago I disassembled COL80HND.COM and tried optimizing the scrolling routine by adding an extra 'hidden' text line and using a dynamic display list for scrolling. My terminal program (Term80) wouldn't even start with it though, probably because of the new handler's add'l memory requirements.

I've set many of my friends up with 8-bit systems for use as terminals, using COL80HND.COM for 80 columns in software. Problem is, it only keeps up with 1200 baud.

Some of them have 2400 baud modems and I'd love to get them up to speed. Thanks for any help.

Tony

p.s. a mouse driver would be great too, so I can add mouse support to a Degas/.IMG/MacPaint image viewer/converter I've been developing.

From: pprice@nid.csc.com
Message-ID: <CJFH7y.BEG@nid.csc.com>
Source record: 103685

The source is not yet posted. On my list of things to do are the
following in order of priority:

Mission Control Room development(40+hours a week)
School(20+hours a week)
New game initial proof of concept work(39+hours a week)
ANSI C++ Committee work/papers (? hours)
Getting old Atari up and seeing if source disks are working
and/or releasing the add-on/interface/bootup structure of AR.

As you can see the getting the source from the disks has not
perculated to the top yet, but fortunantly the crating a new game
has. Though creating a new game on the side is MUCH harder for
me than doing it full(read 80+hours a week) time, and therefore
has by my own estimates a 50% chance of not coming to fruition.
I tried once before to do a game on the side(for GEnie) and found
that the time for my mind to swap from day programming fortran to
night programming in C++ and pascal was to much(ie. it effected my
work performance). Nowadays we are using C++ at work so I hope my mind
requires less swap time(Of course there would be no swap time if
I was doing this full-time, but sadly that is not my current situation)

Take Care,
Phil

I have seen two similar things. One is called "Capture the Flag". I don't think it steals the mapper though. You just lose if the opponent reaches the target spot before you do. There is another one where you "die" if the opponent touches you. I forget the name.

160. 2600/7800 carts FOR SALE

YOU, sir, need an attitude adjustment. I'm not sure why whoever
it was posted that very old (1991, I think) vendor list. The
latest was 10/30/93.

It has ATV and even your firm! It would seem it is Mr. Current
who is 'wasting' his time...

Honey, vinegar, you decide.

166. Need Action! Manuals

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-11 06:59:09 UTC
From: rlcollins@miavx1.acs.muohio.edu
Message-ID: <1994Jan11.015909.21314@miavx1.acs.muohio.edu>
Source record: 103697

I am in desperate need of some manuals for Action!. I bought my
copy off the net some time ago, and I have played with it a lot, but I
would really like some sort of manual so I know all the commands and the
exact way they are supposed to work. (My copy didn't some with anything,
just the cart.)

Thanks!

Later.......

>have the script ready, but I don't know if it is possible to make a
>TSR (terminate and stay resident) program on the Atari.
>I would like to have my program kick in rather than the built in
>'attract' mode.
Well it would probably be easier to do the whole thing in M/C. but I can
think of 2 ways of doing it, both of which need to use some M/C. either
(on a 64K machine), copy the OS to RAM find the OS's atract mode code,
and replace the first 3 bytes with a JMP to your M/C code. Your code would
then jump out of the VBI and into your BASIC code. Otherwise write a little
VBI routine to check location 77, and get it to jump out of the VBI and into
you BASIC code just before the OS atract code gets called (reseting the
register while you're at it). The only thing I'm not sure about is how to
jump to your BASIC code from M/C. It should be possible to do by setting
the BASIC pointers in page zero (locs 128 to 1??) to point to your BASIC code
and then JMP to (somewhere in) the BASIC cart to execute the code
rather complicated... And then you've still got the problem of loading your
BASIC program into high memory, and working out where the first statement is.
Still it CAN be done, I'm sure of it, but it would be a LOT easier in M/C.

168. $$$ Atari 8-Bit Software/Hardware For Sale (Lots!) $$$

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-11 19:42:45 UTC
From: totty@flute.cs.uiuc.edu
Message-ID: <CJHDF9.3uH@cs.uiuc.edu>
Source record: 103698
Cross-posted to: comp.sys.atari.8bit,rec.games.video.classic

I unfortunately need to sell off my classic Atari collection. I started my collection around 1982, when I got my first Atari 800. Some of the games I'm selling still have the original receipts from this time! Most still have the original boxes and documentation!

There are many happy memories here, and I hate to see them go. But, I just don't have the time or space for them anymore. They've gotta go soon, since I will be relocating. I'm hoping I can find a good home for them with collectors on the net. There are some real treasures here. Some of the software is now very hard to find.

I think the prices are fair, but feel free to suggest offers if you think the price is out of line. And, if you buy a lot, I'll be very happy to give discounts. Price does not include shipping. Items marked 'offer' mean I plan on holding onto them unless I receive a good enough offer. Condition of boxes and docs are rated: E (excellent), G (good), F (fair), P (poor), - (none), n/a (not applicable). Reply by email to 'totty@cs.uiuc.edu'.

Take Care,

--- Brian

169. Atari 8-bit items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-11 19:58:07 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097861A.BCE4EC20@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103699
Cross-posted to: comp.sys.atari.8bit,misc.forsale.computers.other,misc.forsale

The following "stuff" (hardware, software, books) will be sold to best
(reasonable) offer. Please pick up any items you are interested in,
there is NO need to buy everything!
Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

Thanks!

***** HARDWARE *****

Except where otherwise notes explicitely, all hardware was in working condition
when used last (I no longer have the Atari computer to test it now).
When problems are known to exist, details are given.

Computer- Atari 600XL, with power supply and video cable; no manuals.
Works fine!

Printer- Star-Micronics SG-10
(Centronics parallel standard interface, for use with Atari
850 unit and parallel cable sold below or equivalent)
Monitor-
1. Monochrome monitor, composite video, no sound, excellent for
80-column work, text-intensive applications and BBS. Picture on
this monitor is MUCH sharper than any color monitor will provide.
Made by BMC (japan), green monochrome; I am asking for offers
(prefer more than $29.99 :-)

2. Color monitor, BMC 13" with composite color and audio inputs
via standard RCA jacks. Excellent picture and sound quality.
asking $85.

Atari CX853 16K RAM memory module for Atari 800
Modem cable (to any RS232 modem) for Atari 850 unit
Parallel (centronics) printer cable for Atari 850 unit
Atari 1027 Letter Quality printer almost new, in original box, with manual,
but does not work properly
Atari 1020 color printer/ plotter with manual.
Another Atari 1020 Color Printer/plotter with manual, this one need work
on print spool, or use it for parts.
Atari paddles
Joysticks- various types and shapes, all tested and working well.
Atari 1030 Modem with manual
Taihaho Direct Connect 300/450 baud modem model TH-003 autodial/auto answer
(I think this connects to the joystick port)
Atari 410 Program Recorder (the original one).

Hardware for sale as-is:
Atari 1010 Program Recorder - belt of mechanism inside came off.
Atari 1010 Program Recorder - save: ok, load: no.
Main units only, without cables.

Atari 400 computer- sold as-is, gives no picture on the TV screen.

***** SOFTWARE *****

Cartridges-
==========
BASIC (CXL4002) with manual.
BASIC (CXL4002) with manual and original box.

Disks- (All are original disks)
======
TimeWise with manual and original box
Sargon II with manual and orginal box
Music Construction set with original binder and manual
Pinball Construction set with original binder and manual
Atari Translator
Atari program Exchange (APX) ATSPEL/AT.WRIT.-program 1.0, by R.S. Kistler
Atari program Exchange (APX) ATSPEL/AT.WRIT.-dictionary 1.0, by R.S. Kistler
Atari DOS 2.5 with manual

plus about 50 generic disks with shareware, and many types of programs
(word processors, terminal emulators, utilities of all sorts, games, etc.)

Cassettes-
==========

Joystick Sketchpad with manual (new, sealed)
apx Eastern Front 1941 (with manual and original box)
Thorn EMI Compute 4 and Reversi (in original box with instructions)
Atari Statistics I (with manual and original box)
Atari States and Capitals (CX4112)
Atari Hangman (CX4108)

Books-
======

Bill Carris- Inside Atari BASIC
ICD SpartaDOS Construction Set
Your Atari Computer
Computers for Kids- Atari edition
Albrecht, Finkel and Brown- Atari BASIC- XL Edition
COMPUTE!/Richard Mansfield- Machine Language for Beginners
Atari BASIC Reference Card for Experienced Programmers (Atari, 1983)
An Introduction to the Atari DOS 3 (Atari, 1983)

Please e-mail offers to COHEN@BORN.PHYS.VIRGINIA.EDU , or call (804)293-8973
late evenings in case you have no e-mail account (prefer e-mail, please).

>simpler for your screen saver.

That approach wouldn't work because when you swap something from main
to expanded memory, that process stops, and only starts again when it
is switched back. There is nothing that allows the Atari to do true
multitasking beyond VBIs.

From: lordthan@news.delphi.com
Message-ID: <2h0arn$7c8@news.delphi.com>
Source record: 103703

For the record, "Realm of Impossability" wasn't the sequel to "Zombies". It was the reincarnation of it. Zombies was produced by a small software house which went out of business like some many other companies producing software for the Atari back in those days. When they went under, the rights to the software reverted back to the author - who quickly relicensed the game to Electronic Arts and renamed it to Realm (adding a bunch of levels in the process).

176. More support for your Atari 8-bit.

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-12 11:36:02 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9401121135.AA15121@cs.utexas.edu>
Source record: 103456

MORE SUPPORT FOR YOUR 8-BIT FROM RICHARD GORE

HARDWARE.

The Yorky 256k plug in memory upgrade for the Atari 800/600XL computers.
This memory upgrade simply plugs into the PBI port on the back of your XL
and gives you 256k of bank switched XE compatible memory. It is supplied with
a printed manual and a disk of support software.

Current price is #50 (UK pounds) plus #2 shipping.
#5 shipping if outside UK

(Current price in US dollars including worldwide shipping = $85)

We are currently working on several additions to the standard Yorky unit,
these include
i) Battery backup facility
ii) Ability to be connected to an XE computer
iii) In built printer interface
iv) PBI feed through port for addition of other PBI peripherals

You will be advised if/when any/all of these add-ons become available.

SOFTWARE

The two games available now are:

1) JAWBREAKER Guide a pair of chomping teeth around a maze eating as much
candy as you can, but don't forget that important dental
hygiene. This package includes two separate mazes originally
sold as individual games as well as a pause function.

2) MOUSEKATTACK Plumb all the levels of Rat Alley but watch out for those
giant rats. Classic arcade action for one ot two players
(on screen at once) with improved joystick control and a
pause function.

Both of the games are available NOW on disk, tape or Rambit Turbo tape!

PRICES: UK (inluding p&p) #4.50 each

Worldwide (including shipping) #6.50 or $9.00 per game

SPECIAL JANUARY OFFER
Buy both Jawbreaker and Mousekattack for only #6.95 in the UK,
or #10, $15 overseas.

We also hope to start an e-mail software service. What will happen (hopefully) is you will order your software and pay in advance, upon receipt of your payment I will then e-mail you your chosen software and documentation. It will then be upto you to uudecode it and transfer it onto an Atari 8-bit disk and finally unDiskcomm it. This of course requires less work and materials on my part and so the prices will be reduced provisionally to #3 ($5) per game title. It is hoped this service will start late in January.

We also have several more games in the pipeline - more details will be released when we are closer to their completion.

* *
If there are any software authors out there with products finished or nearly finished we would be very happy to consider marketing them. This applies to new software and old games so long as you have the rights to them.
* *

For more details or to order write to:

Richard Gore, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

or e-mail RG9@UK.AC.YORK.VAX or RG9@UK.AC.YORK.TOWER

(for those outside the UK you may have to invert the uk.ac.york.xxxx)
(part to xxxx.york.ac.uk)

Telephone enquiries can also be accepted over the weekend period from 7pm on friday evening to 4pm on sunday afternoon.

In the UK phone (0302) 784642, outside the UK refer to your phone book on how to dial internationally, and ask for Richard.

177. Free Scanner for your Atari (?)

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-12 11:58:02 UTC
From: gfenwick@mcs.dundee.ac.uk
Message-ID: <2h0oka$m6s@dux.dundee.ac.uk>
Source record: 103459

I seem to remember reading something a few weeks ago about a project in a magazine which used a special interface and an infra red sensitive component (resistor?) attached to a print head to make a scanner, which set me thinking...
Why the interface? The Atari can read a resistance through the joystick port (this is how paddles work after all). If it was possible to get a light sensitive resistor which gave the
correct resistances, it should be possible to built a scanner with just this, and some wire (assuming you have a printer).
Has anyone tried this- i've been thinking about looking for a suitable component, and i'd love
to know if it works. Or is there any reason why not?

Yes. The write protect sensor is merely an optical switch that is operated by
the existence/non-existence of the disk/write-protect tab. I have seen
several drives with three position switches: always write-protect, use sensor,
never write-protect. I never actually installed one, but I believe a VOM and
a few minutes will reveal how to connect the switch.

180. Atari 8bit or ST emulators for MSDOS or Unix ??

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-12 20:46:53 UTC
From: natasha@zwicky.unm.edu
Message-ID: <2h1njtINNcp7@lynx.unm.edu>
Source record: 103460
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I currently have an AMD 486DX/40 with MSDOS 6.0 and Linux OS's.
And from my more memorable computing days an Atari 1050 disk drive with
lots of old programs. All of which are unusable since I traded in my
130XE a couple of years ago....

I have recently heard that there is an atari 8bit emulator that can load
programs off the 1050 drive through the PC joystick port.

Does anybody know where this can be found and/or purchased?

I also would like to know where a cable that would adapt an atari serial into
the joystick port could be found or how it could be made?

I remember hearing a couple of years ago that someone was writing an
atari emulator for Unix on the net; has anybody heard anything about this
lately?

I appreciate any comments and help! I have so far run into several dead-ends..
Please reply via e-mail.

Thank You

Marc Bluefire

Subject: M.U.L.E.
To: snyder10@convex1.tcs.tulane.edu (Mike Todd)

I am having trouble posting; could you post this article for me with the subject as M.U.L.E.?

Thanks in advance
matt
mtm@walsh.dme.battelle.org
==========

Recently I have taken up a renewed interest in the old favorite 'MULE'. I've figured out the basics, of course, but am curious if I am missing any nuances or special rules not obvious in the game. Would also love to get a copy of the DOCS to see the cover art again.

So does anyone have a copy they would like to sell? I'm more interested in the manual than the game itself; my friend already has a C-64 (blecch!!) version.

...and any neat MULE tips to share? I'll start:

**always leave one surplus food and/or energy unit; it won't spoil.
**come in through the bottom of the house to get closer to the bar upon entry.
**if there is a shortage of MULE's you can let them all go and screw the other players
**the Crystite assessor is full of it. The amount of crystite you get on a piece of land is only occasionally proportional to the 'fertility' dots.

BTW...the computer cheats. I've seen him change 3 land units when he had no food at all!! I have a hard time changing 2 when I'm short just one unit of food!

And finally...has anyone ever figured out if the different aliens truly are different in their abilities?

MTM 'Matt the Mentat' Walsh ^^ mtm@walsh.dme.battelle.org

Visualize Impeachment.

Not speaking for Battelle.

If you tear the drive out to put a switch in to bypass the write
protect sensor, check for dirt or something blocking the light
path for the sensor. Perhaps a little cautious use of a hankerchief
passed thru the sensor gap may clean it .. with perhaps a touch of
alcohol or tape head cleaner.

I have often seen pieces of write protect tabs torn off in this
location.

One of the drives I know has been tested and found to be bad but they
both seem to work fine. I only get errors when theres a bad sector (Error
140) or at least it seems to be a bad sector; im sure it is.
I thought of getting 5 1/4, 720K drives but I've heard that the ATR8000
dos'nt work with them right so 8" drives are what im more interested in
getting now. My neighbor used to have up to the ceiling. you can store a meg
on one of them, there probably cheaper than anything since no-one wants them
anymore, I could easily use both 2, encased 8" drives along with what I
currently have, and heck, the size of them dos'nt matter since no one else is
gonna read them anyways. Only problem is where to store them and I can find a
box or something for that.
Im curious how you hard-wired a standard drive as D1: could you boot off
it then? It must have had to been a ss/sd disk unless your using a different
OS ROM.

Be sure not to use rubbing alcohol as it has an additive that leaves a gummy residue. The best type of alcohol I have found to clean tape heads and such is PGA <g>.

This sounds quite interesting. Is it COMPLETELY XE compatible? One of the
things mentioned in the docs to the Claus Bucholtz 256k upgrade (RAMBO) was
that the upgrade had to be done internally since the PBI did not contain all of
the necessary signals. Does this upgrade require any internal mods? How did
you get around the above mentioned fact.

The only other cart based upgrade like this just plugged into the cart port and
was nothing more than a battery backed-up removable ramdisk (not XE compatible,
and EXPENSIVE. Canoe computers?).

186. AC Renewals

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-13 18:41:01 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9401131814.AA09643@phinet.smithkline.com>
Source record: 103465

[Lawrence, please post to all nets, thanks! -Ben]

There seems confusion over renewal dates for charter subscribers to AC. The Premier Issue (December 1992) was distributed for free as a result of the promise made by the Mail Campaign Committee in 1992 to give people who participated in the Campaign a chance to "sample the goods" before they plunked down their money for a sub. The mass mailing of the Premier Issue in November of 1992 went out to about 700 people who were Campaign Respondents & who were informed about what to expect.

My Editorial in the December 1992 issue explained the context of the Premier Issue relative to subscriptions. Those of you in doubt should pull out that issue & read my editorial. In addition, the subscription form printed in the December 1992 issue clearly states that the Premier Issue is the first issue of your subscription.

Free magazines were also distributed to an additional 1100 people who may, or may not, have been informed as to the status of that issue relative to a subscription. However, no one can plead ignorance, as they should have both the subscription. However, no one can plead ignorance, as they should have read both the subscription form & my Editorial before they subscribed.

Subscribers in effect subsidized the deadbeats who took the free issue but who subsequently failed to subscribe. I recently conducted a rough stat check of the Mail Campaign data compared to AC's active October subscriber list. What I discovered was that 60% of the people who signed Campaign pledge cards never ultimately subscribed in 1993. The additonal 200-odd people who signed up for AC during our early days came from the additional 1100 distributions that were made above & beyond the Campaign respondents. An extraordinary effort, for rather poor response.

I apologize for failing to include a cutoff date in the notices. The notices were prepared last July, & I regret to say I simply could not see this far ahead. Too many people are taking AC for granted, as a kind of institution. It isn't; it's an experiment conducted entirely by amateurs. The failure of the community to keep that in constantly in mind is destabilizing the publication.

I recommend people should re-read my articles in the April, June, and August issues of AC to reacquaint themselves with the true nature of this enterprise & to recall details pertaining to subscription policies. This ground has been covered previously.

: ...and any neat MULE tips to share? I'll start:

If you are playing 2 or more players and you want to trade between just the two of you without anyone else's intervention, you can 'collude'.. THis is done by one of you on the selling side; the other on the buying side.. You must both press the joystick buttons at the same time, ie: 1 2 3 NOW!

The screen will turn pink (i think) and the words 'collusion' will appear at the bottom of the screen.. Then the seller can set his price for whatever he wants and the other guy can go up there and trade with him... The timer runs out, then the regular trading begins...

Also, when you have 2 of the same sorts of plots next to eachother, you automatically produce one more unit.. Also for every three of the same sorts of plots you have (dont have to touch) you produce an extra unit..

Also it helps to rotat your production around.. move food and energy around or else the plots stop producing so much (mostly this applies to food).. And always play in tournament mode.. Crystite is Great!!

Oh, one more thing.. If you are holding crystite (or smithore in regular mode) and waiting for a good price to come up, be sure you sell before the 9th round if the pirates havent come yet.. They will come by the 9th round usually...

Oh yea (I keep thinking of more things (this is a great game!)) Mules require 8 units of smithore to be built.. Dont allow the computer to sell smithore to the store early on.. Buy it yourself... As the store runs low the price of it goes way up.. THen of course when its up past 100 and you have been buying it all from the computer, turn around and sell it to the store.. You will rake it in!! I have had games of over 30000 credits!!

Good luck!

188. $$$ Classic Atari Sale (Jan. 13 Update) $$$

Newsgroup: comp.sys.atari.8bit

January 13 Update

Classic Atari Collection Sale
Brian Totty
totty@cs.uiuc.edu

I was very (pleasantly) surprised by the demand for the classic Atari stuff I am selling. Hopefully this means they are going to good homes. Here is what remains, including some items that are pending sale.

Many people have asked about Atari 800's and disk drives. I have a Rana and Indus drives and one other 800 that I might put up for sale if there is sufficient interest (I was going to keep them myself, but if someone can make active use of them, I might let 'em go). Send me email (totty@cs.uiuc.edu) if you want any of this.

There's still some great software down there (including my personal favorites: Conan, Hitchhiker's Guide, Six Gun Shootout, Universe, Whistler's Brother, Wizard & the Princess, Mail Order Monsters, and Micro League Baseball). If you have questions about the software, I'll be glad to answer them.

Since this is long, unless requested otherwise, I'll post updates just once or twice more, and then email to people I have heard from, so send me email if you want to receive these updates.

190. Switch boxes; print buffers (parallel & serial) for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-13 22:19:00 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <009787C0.BFDCD3A0@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103469
Cross-posted to: comp.sys.tandy,comp.sys.cbm,comp.sys.atari.8bit

Switch boxs, print buffers for sale-

1. Quadram Microfazer Serial/Serial 64K buffer; has reset and copy buttons, ready, error and copy LED indicator lights; comes with a power cable with an external little transformer that plus into the AC wall outlet.

2. Quadram Microfazer Serial/Parallel converter + 64K buffer. The rest is similar to the description in #1 above, except that this model is also capable of drawing power from the printer itself (but you will get the power cable, too).

3. QVC parallel print buffer, 64K, practically new (used only once, to test it!) in original box with manual. Has a lot of buttons and lights, for copy/stop/ bypass/resume/test (etc.). This print buffer has Centronics connectors, and I can send a Centronics/Centronics cable (to be used to connect the buffer to the parallel printer) if needed.

4. Black Box A/B/Switch box for parallel printer, with 3 Centronics connectors on the back. Supports 2 printers connected to the same computer (e.g., one printer for drafts and another for letter quality, or one loaded with computer forms and the other with single-sheet letterhead paper). I can supply the pair of centronics/centronics cables used to connect the box to the printers, if needed.

5. MP-401B AUTO DATA Switch parallel printer automatic sharing device.
Four computers to one printer (parallel) auto-switch:
Supports 4 computers INPUT - one printer OUTPUT. DB-25 (IBM PC style) female connectors on back, for use with parallel computer printer interface. Comes with a power cable with a 9V small wall transformer that plugs into the AC outlet.

I would like to sell to best reasonable offer. Please respond via e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 . Thanks!

[Article crossposted from comp.sys.atari.8bit]
[Author was Brett D. Bensley]
[Posted on Tue, 11 Jan 1994 01:10:23 GMT]

All I can say is thanks again. Your wonderful VENDOR listing was
incomplete. My firm, Bensley Consulting, has been left out again. Though
we may not have created AtariWriter, or Turbo Basic, Centipede, we have
created a number of educational, utility, and application programs.
It is so wonderful to see the outstanding support we have gotten
from the Atari community. Well, again I say thank you and this time for the
indication that our efforts in writing reasonable, functional programs for
the 8-bits are worthless. We are very glad to drop our wasted time, now
since we truely know it is wasted.
Good luck to you all!

Brett Bensley
Bensley Consulting

Message : 677 [Open] 6-16-93 12:58am
From : Bill Wilkinson
To : All
Subject : Hello again...and good-bye...
Sig(s) : 1 (General Information Files)

Well, it has been quite some time since I have been signed on here.
For which I apologize, but I plead the exigencies of overwork and
overstress. Anyway, here I am, and that's the "Hello again" part
of my "subject."

But the "good-bye" is because I will soon be leaving the Bay Area.
I am heading off to the great Northwest...otherwise known as Seattle.
Well, Bellevue, actually, to those of you who know the difference.
Yes, that is Microsoft country. But no, I am not going to Microsoft.
However, I am going to a Windows-oriented company (you know, PC, 80486,
Messy-DOS, etc., etc.); to wit, Asymetrix, Inc., a purveyor of multi-
media tools and applications for Windows ("Toolbook" is their first
and still base product).

I will be leaving in less than two weeks, so now is your last chance
to sling arrows, etc., at me. For those of you who play internet
games, I will have an internet address. (And if you don't use internet
yet, you can do so by modeming to 408-736-8849...The Stainless Steel
Rat BBS and internet connection..."TheRat.Kludge.Com" on internet/uunet.
I can be reached there via "wfw@TheRat.Kludge.Com", again for the next
couple of weeks. "bill@Objy.Com" will get a faster reply for the next
few days, and I will leave a "forwarding address" there if possible.)

One question (which I could probably find the answer to by scanning
recent mail): Why did Atari's stock take off last week? Why is
dropping just as rapidly this week?

Thanks for all the good Atari times; I probably won't make another
meeting, unfortunately. Oh, yes, and I guess you can take me off
the newsletter mailing list. Sorry about that.

Bill Wilkinson

Just an old post I picked off of BAAUG.
```

194. Updated VENDOR list! (1994)

(Thought "Brett D. Bensley at Eastern Illinois University" - AKA flaming-w/o-thinking or advertising moron-boy would want a copy!)

Damn guy - at least let us know you're still producing 8-bit software once in a while! What has this "Bensley Consulting" produced in the past year or two for the Atari 8-bit line? Your msg was out of line and rather uncalled for. If you'd like additional business, it is essential to advertise! If someone from the company has net/email access, even better! Just post here letting us know what you're working on / what you're currently selling / pricing / whatever! I'm sure you could muster some business by curtiously asking out here in "net-land". This is the first I've heard anything about this company. I'd even venture to say that some users would still like to know more... please enlighten us as to what "reasonable, functional programs for the 8-bits" you produce!

Received via email from Mike Current (thanks!):

Message-ID: <940114.00930.RICORTES@delphi.com>
Source record: 103473

It's been done on the ST,. but you can only transfer about 16 characters/sec. I did a couple of hacks to convert a Joystick to run transfers like the old MPP modem, if you need info let me know & we can take it to E-mail. BTW: if all you're doing is going
text from Atari to joystick serial, you can get it to go up to 19,200.

Nope, it was a simple photo-transistor(?name?) connected by wire directly to
the joystick port. Check the old ANALOG Computing mags... I don't remember
much about it. Although I did build it, and it worked ok for me. When my one
printer died, I didn't feel up to retiming the program for the new print head
speed (went from a Gemini 10X to a Star SG10)... like I said, it worked "ok".
Nothing fantastic about it - limited grayscale, but for it's time - NICE!

197. Parts computer sacrifice

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-14 05:22:20 UTC
From: dbstrutt@acs.ucalgary.ca
Message-ID: <Jan14.052220.62921@acs.ucalgary.ca>
Source record: 103483

I've got a 600xl which was the runt in a two computer transplant
of best parts which I'd like to get rid of for a nominal amount,
say $5 plus shipping. The computer has an escape key that keeps
pressing endlessly, and one of the keyboard decoder chips is
missing. Good for parts though. Also included is a power supply
with the DIN plug part (what the heck does DIN stand for?)
missing, the end that plugs into the computer. Please don't make
me throw this stuff out!

198. 8-bit Emulator for a 486

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-14 10:25:54 UTC
From: palm_erd@csusys.ctstateu.edu
Message-ID: <1994Jan14.052554.1@csusys.ctstateu.edu>
Source record: 103476

I just recently ftp'd a Commodore 64 emulator that runs great on a
386-40 or faster with VGA. It runs whatever I throw at it, but my 8-bit days
were with the Atari 800XL/400/130XE. I'd like to see an Atari 8-bit emulator
that properly emulated sprites and sound. The only one I know of so far is
the Xformer for the Gemulator. And since the Xformer pretty much didn't run
any of the game discs I used (even with the cable I bought) on my ST I gave
up on it. My latest gadget is the SIO2PC interface cable between the
8bit and 486 PC. I'd rather see a software emulator running. I know the
hardest things to emulate would be the Interrupt Lists and sprites, but hell,
it's got to be possible. I already have the majority of my 8-bit software
sitting in a 10 pack of HD 3.5" (you can store 12 atari SSSD discs on one PC
disc). The rest are protected.
Please e-mail me with any responses as I don't read this newsgroup (I just
registered it on my newsreader, and I have alot of back reading to do).
Eric

199. Classic Atari 8-bit stuff (lower prices)

Newsgroup: comp.sys.atari.8bit

Here's a re-post of used 8-bit equipment I have for sale.
In this case, the first poster who offers the listed amount
gets the item. Feel free to bid less than the listed amount,
but I will wait about a week after your posting for higher
amounts to trickle in. Postage to be paid by buyer; package
deals have preference. All prices listed in $US:

Hardware, all in working condition:

Atari 800 $25 (now Qty 2)
48K, stock, with power supply

Indus GT Disk Drive $50
includes P/S and cable, all manuals
and Indus software (word proc., data
manager, spread sheet, DOS XL with
synchromesh II)

Atari 850 Interface $40
power supply, serial cable, printer
cable

Hybrid Arts MIDITRACK II $70
interface with manual and software

Cartridges, with box and docs, full working condition.

Atari BASIC cartridge $10
(includes BASIC reference manual)

Cartridges (all w/o docs or box, but in working condition):

Atari BASIC $5
Atari Centipede $5
Atari Star Raiders $5
AtariWriter $5

Books (all reduced):

Compute!'s First Book of Atari $5
Compute!'s Second Book of Atari $5
Compute!'s First Book of Atari Graphics $5
The ATARI Assembler (Reston) $5
ATARI Games & Recreations (Reward Books) $5

(for collectors of Atari arcana)

Computers for people (1982 dilithium press) $4
DOS 3 (Atari) $1

Disks (originals, working condition, but no docs or box):

Mr. Robot & His Robot Factory (Datamost) $5
Rescue on Fractalus (Epyx/Lucas Games) $5

All the above are in working condition. On request, I can throw in
the following non-working (but classic) hardware with any other
purchase:

410 Program Recorder

> Ah, no. Realm of Impossibility is ALL new levels. It is a
> sequel. Tom

"Realm" added only 6 new levels. There are still only seven
crowns, but some dungeons are locked so you also must find
keys.

Zombies needed a translator on the XL/XE, and I think it scrolled
more smoothly. Realm has a built-in cheat; during play, hold
OPTION and everything but your player freezes.

from Zombies:

THE SEVEN DUNGEONS OF WISTRIK THE EVIL
1. CANKAYA KEEP
2. TARTARUS
3. ERGAZI SHEOL
4. STYGIAN CRYPTS
5. EREBIAN VAULT
6. THE ABYSS
7. REALM OF IMPOSSIBILITY

from Realm of Impossibility:

THE THIRTEEN DUNGEONS OF WISTRIK THE EVIL
CANKAYA KEEP TARTARUS
THE ABYSS ERGAZI SHEOL
STYGIAN CRYPTS *PHLEGETHON
EREBIAN VAULTS *PITS OF GEHENNA
*ETHEREAL PLANE *ABADDON
*CHARON'S KEEP *MINES OF MINOS
REALM OF IMPOSSIBILITY

201. The Newsroom

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-15 01:33:21 UTC
From: NOLRAM@delphi.com
Message-ID: <940114.74001.NOLRAM@delphi.com>

Does anyone have icons for the Newsroom program? a good converter program? or any other font or clip art?

202. Wiring d5-d8: anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-15 03:48:27 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJnJwr.313@utnetw.utoledo.edu>
Source record: 103482

I recently starting wiring up a few extra drives to run off my Astra drive controller. They seem to work fine BUT, I recall several old Atari BBS's pre-1988 or so that had disk drives configured as d5 through d8. No, it wasn't a ram or hard drive partition... this was accomplished through a minor cabling change - anyone know what needs to be "twisted/interchanged/hot-wired"?

For now, I just want to stash two extra 360k drives up around d7: and d8:... later, I may just add a couple 720k's or who knows - if I get crazy enough, I'll try out some of these 8" drive monsters people just started chatting about here! (One drawback to adding 8" drives though... well, two: they always spin, and they draw a LOT of power!) Wow! Thought the 8" whizzer was nearly forgotten!

-Tim

204. XEGS backwards compatability question

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-15 06:28:54 UTC
From: dbstrutt@acs.ucalgary.ca
Message-ID: <Jan15.062854.24822@acs.ucalgary.ca>
Source record: 103487

I've been trying the XEGS I picked up yesterday with cassette
games for the 400/800 with nada success. What I'd like to know
is, does it have similar problems with older disk games? And I
thought I'd hit the big time after limping along with a 16K 400
for so long.

Atari Archive: 8bit/faq2.txt

All Known World-Wide 8-Bit Atari Vendors and Developers

A Companion to the Atari 8-Bit Computers FAQ List

Revised 12-Jan-94

This file is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group on the 15th of the month. There is also usually a fairly recent copy
available on the Atari Archive as the file 8bit/faq2.txt, but the most recent
copy may always be requested from mcurrent@carleton.edu.

The main portion of the FAQ List is posted to this discussion group on the 1st
of the month, is called 8bit/faq.txt on the Archive, and is also available from
mcurrent@carleton.edu.

Please send updates to Michael Current:

Source record: 103490

I've thouroughly enjoyed my AC subscription. I particularly liked the December, 1993 issue on video hardware hacks. Now, I'm sure the editor has plenty to write about, but I would particularly like to see some very basic information about how the 6502 works. Just basic electronics about computers that might not be specific to the 8-bit.

Which games in particular? Many titles made before the XL used
some 'undocumented' memory locations that changed on later
models.

If you have a disk drive, all is not lost. You can load a
'translator' which replaces the XL/XE OS with the 400/800
one. _Most_ programs will then work.

I have a large-ish collection of games and I keep track of those
which require it (and the 400/800 ONLY games). Lots of Synapse
games needed it.

Message-ID: <1994Jan16.133242.13531@coplex.com>
Source record: 103492

I'm not sure if it was just a wiring change. ICD used to sell a special version of the US Doubler ROM that would let the drive be used as D5-D8. It could probably also be done by copying the original Atari ROMs and changing a few bytes.

212. Re: XEGS backwards compatability question

Actually it looks like the problem is not as bad as I first thought. The
problem seems to be limited to my copies of Frogger and Zaxxon (my best
cassette games 8-(. Thankfully my Epyx cassettes work.

>(One drawback to adding 8" drives though... well, two: they always spin, and
>they draw a LOT of power!) Wow! Thought the 8" whizzer was nearly forgotten!
>
>

They don't have to spin all the time ... it just takes a bit of hacking to add a optoisolator solid state relay for the motor circuit. The drive motors on a lot (most) of the 8 inch drive ran on 60 cycle AC, hence the need for a solid state relay rather than a simple trnasistor switch, and the reason a lot of designs just spun the motor continuously.

214. Stuff for sale...

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-16 23:40:45 UTC
From: Ordania-DM@cup.portal.com
Message-ID: <101145@cup.portal.com>
Source record: 103495

Updated 1-13-94 (some stuff sold, some stuff about to be sold, and more stuff added)

BIG NOTE: The prices listed below are automatic-sale prices, if you offer that price, I'll sell you the item. The prices are close to list price in many cases, mainly because I haven't been 'in' the Atari scene for several years. Feel free to make any offer on anything I won't be nasty if I don't like it, I'll just say no. And who knows, if the item doesn't sell, I may send you mail and accept your offer. However, some items have a value beyond what they originally sold for - notably the ICD items, some of the books, and upgraded items. These special items will not be sold cheaply, though you might be able to buy them from me for less than what is listed below.

Price Hardware Item
SOLD 150 Magnavox RGB Display 80 Monitor
100 XEP 80 Column Interface

100 Panasonic KXP 1091i Printer (parallel printer interface)
100 XDM121 Atari Daisy Wheel Printer (direct connect - uses SIO cables)
25 Seikosha Printer (Atari direct connect)

100 Indus GT Disk Drive with Write Protect Modification
100 XF551 Disk Drive with 3.5" switchable EPROM. (with addition of 3.5" mechanism, you can use 3.5" diskettes at the flick of switch)
85 XF551 Disk Drive
SOLD 65 1050 Disk Drive

70 Atari 800xl
50 Atari 800 (Axlon 32k ramboard, 65C02 CPU)
SOLD 40 Atari 800 (48k)
30 Atari 800 (Rev 1, no right cart slot)
20 Atari 1200 Motherboards (4, price is for 1)
15 Atari 400 (2, price is for 1)

25 Sega Light Gun with Atari Cable Converter (home made, works great)
15 CX85 Keypad
15 CX22 Trackball (2, price is for 1)
15 Voice Box (photocopied docs & software)
10 XM301 Modem
SOLD 10 1030 Modem
5 1010 Cass. Drive
5 410 Cass. Drive

5 Track and Field controllers (2, price is for 1)
5 Driving Paddle Controller

Cassette Software Item
10 Tanktics

Disk Software Item
20 Mail Order Monsters
20 Ghostbusters
20 Seven Cities of Gold
20 Ultima II (no cloth map)
20 Spy vs Spy I & II
15 Archon

It would be nice if someone would take over the modifications for
Kermit v. 3.7 (I think it's the latest) and make it compatible w/ the
new packet sizes, etc. I like Kermit, but when I really want some
d/l speed, I have to get out of Kermit and boot up Bobterm. Works,
but not an elegant solution.

Message-ID: <1994Jan17.043049.1@csusys.ctstateu.edu>
Source record: 103497

I'm looking for a replacement ATR-8000. The one I have now just spins the floppies for a second, and doesn't get recognized by the Atari. It's a pity though as it had a 256K co-power 88. I have a ton of CP/M discs that I got with it, that I can't access now, unless I get it fixed (I doubt the repair bill would be worth it), or replaced with another.
Does anyone know where I can get one in good condition for a good price?
I onlu paid $50 for mine at last years Trenton show, with the co-power 88 and 3 drives, 2 360K and 1 80 track 720K.

Therefore, we must all go back to using the systems we most enjoyed gaming/ hacking/telecom'ing with - the Atari 8-bit - before this quake shifts to a global tour and visits YOUR hometown! See! You're all going to be punished for moving away from your faithful 8-bit! I knew it! I knew it all along! (Glad I kept my vigil going all these years... had that Atari still wired up and ready to be used on an old desk for a reason!) Hurry, there's still time! Fire up your old 300 baud modems and let's all go for a massive "revitalize the Atari 8-bit sig" on Compuserve! Support your local 8-bit dealers before it's too late! Call them now! Get them back in business! Wake 'em up, I don't care if it's the middle of the night! A catastrophe is coming unless we all work together as one happy Atari family! All right, let's sing now...

```
%#Y(X V . $$@ 1sdgz l23FG dg
dfdfg

Cool, but will it run on 48K? I hate those programs I can't run on
a good ol' 800.

224. ZMODEM anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-18 06:38:27 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJtBs4.H2I@utnetw.utoledo.edu>
Source record: 103405

Ok, yet another plea: Anyone heard of or working on a zmodem project for the Atari 8-bit? I recall most of the coding involved for xmodem and ymodem, would zmodem be so much different? I know it has a plethora of new, lengthy features... but would zmodem be possible in a stripped-down term program? Would you need extended memory for... something?

I recall some projects in the works months to YEARS ago, but no new versions have made their way to the archive at umich. Even one of the largest Atari BBS's left doesn't seem to have anything... ugh... not looking promising:
extended Bobterm - 1992 (memory enhanced machines only)
Ansiterm > ver. 1.0! - 1992/1993 (Robert Sinclair was working on new updates, a "finished-looking" main menu, etc.)
Omniterm/Omnicom - 1993... no changes in a long time... any personal mods?
Amodem - 1988 is about the last year for updates on this monster. IT REALLY IS AN INCREDIBLE PIECE OF WORK FOR BEING WRITTEN IN BASIC!
EXPRESS! - Keith Ledbetter - the old versions had some bugs in the file transfers... been waiting for a few fixes or a new release since about 1988! The BBS program is great, the term programs just didn't work "right".

Also, whatever happened to the game-oriented term programs? I had one (or so I THOUGHT) that let you play tetris while you transferred files... lost it apparently! There was a GTERM or somthing that allowed for FULL graphics capabilities on-line. All you had to do was add a few characters here and there in your bbs text files, and the term-program upon seeing them would draw just about anything on your end... sound too! The BBS never had to send much more than simple "engage"/"drawpoints"/etc., since the term-program took care of the major overhead. How about the old... ARGH, forgot that famous old #&("(!&... it was written around 1982 or so, allowing you to transfer files while typing back and forth to each other. At the time, only 300 baud was available, and it could take an hour for some of the transfers. If you decided not to type much, it would run a little faster, but at least it gave you the option!

-Tim

PS: I think it's time I started back into the "do-it-yourself" term programs. I came out with the first official full disk sector-by-sector transfer option for amodem in the VERY early 80's LONG before Shrink and DisComm were ever considered. Heck, I even beat old "Crider's Compression System" or CCS for short. Anyone remember EITHER? Who knows? Maybe you'll see my name up in the credits for a new zmodem package soon! (Any partial work done with zmodem by ANYONE out there yet? I'd be willing to help someone finish up!)

225. Re: XEGS backwards compatability question

Newsgroup: comp.sys.atari.8bit

>I have a large-ish collection of games and I keep track of those
>which require it (and the 400/800 ONLY games). Lots of Synapse
>games needed it.

Do you know the cause for games running only on the 400/800? Other than the OS, which the Translator takes care of, I can't think of what other differences would cause a program to fail.

Yeah, the Synapse programs were notorious for using the absolute ROM locations for keyboard and screen I/O. Even their SynAssembler and other development tools did this. It's a shame. I also recently found out the original Jawbreaker did this. :-(

Personally, I feel that it is Atari's fault that so many programmers cheated like this. Providing OS vectors with the address -1, that had to be called by PHA'ing and RTS, was a cumbersome process IMHO. While JMP vectors would have been best, that would have taken more space. At the very least, Atari should have used the actual address in the vector table, so that they could be called with a simple JMP (indirect).

One time, Bill Wilkinson had said Atari chose the best approach, and only short-sighted individuals would think that the approach was clumsy. Except that he neglected to mention why he felt this way, and so I still wonder whether it is valid. Unless I've missed something, I certainly know JMP or JMP () vectors would come out faster and smaller in any program I've done. Regardless of this, I still maintain that Atari used the wrong approach, for the simple reason that programmers felt they had to bypass it. It's a little blemish on what was otherwise the best OS of its time by several orders of magnitude.

It brings up what I would call the definition of the 'perfect' OS. While most would agree that this is impossible, the perfect OS could be defined simply as an OS that every programmer would be content to use, and not feel they have to bypass it.

>cassette games 8-(. Thankfully my Epyx cassettes work.

What problem does Frogger have? I wrote it, and it should work fine on the newer machines, as it does for me here. That is, as long as you have my version. They did replace my program with someone else's, which has two player simultaneous play and I'm not sure what else. (Probably not as many colors) :-)

(Mr. Harris laments the way the Atari8 os is written.)
Now, I said something once about someone providing Mr. Harris
with some intelligent comments. I certainly didn't intend
to be the person to do it. But, since Mr. Harris states it is
his HUMBLE opinion that the Atari8 os should have been done
differently I'll state my opinion as I see other programmers
stating it. Those programmers that made direct jumps into
the OS were not playing by the rules. Essentiall the way
the os was written was to allow updates to the os while making
backwards compatibility. I have done a little programming
and never found the need to make direct jumps into the os.
Jmp or jsr ciov or sio have worked fine and I appreciate
that it works on all machines.

```
Atari 2600 items for sale:
High quality game joysticks (various types).
Atari paddles
2 Atari catalogs from different dates.
CARTRIDGES-

Q*Bert
Epyx California Games
Epyx Winter Games
Spectravision Gangster Alley
RealSports Football
U.S. Games Towering Inferno
Coleco Donkey Kong
Mattel Space Attack
Activision freeway
Video Pinball
Apollo Shark Attack
Moon Patrol
Astroids
**************************************************************************

Intellivision cartridges-
All except BurgerTime have original boxes, some have manuals and overlays-

Las Vegas Poker and Blackjack
The Official Carnival by SEGA
TRON MAZE-A-TRON
Snafu
Reversi
Donkey Kong
BurgerTime
**************************************************************************

Other cartridges-

Atari 7800- One-On-One
Atari 5200- Pac-Man

I also have a collection of TI-99/4A cartridges (games, including ones from
Atari as well as original TI cartridges, education, utilities, etc.)
and some hardware. If interested in something specific or if interested in
receiving a list, please e-mail me at the address COHEN@GOMEZ.PHYS.VIRGINIA.EDU

Thanks!

>For the good old 8-bit Ataris? If that's true, has anyone got one to
>sell me? (1200XL or 130XE and 1050 or better disk drive). :-) Or should
>I trade my Sparc for one? :-)
>

The first system it will be out for is PCs. Expect to need a
cd-rom, sound card(with midi, though not required), a couple of
megs of memory and '386 or better. Super vga is preferred. It
still is a long long way from completion, and because I am doing it
on the side it takes longer to complete(ie. it will be more than a year
before I have a final version done). I can't describe the game design
since it is early (I have it, it's just confidential at this point
because time to market is so far down the road). And of course
since it takes second priority to my day job, there is always the
chance that it may interfere with day work and would therefore have
to be abandoned.(Though I think I have learned how to mentally avoid
this from happening).

- Phil

P.S.
One of the main causes for me to revive interest in doing a game
is not only my own primitive urge to create real neat games, but
the fact that many of you remembered my old games much to my
surprise.

236. Re: XEGS backwards compatability question

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-19 07:52:22 UTC
From: jharris@cup.portal.com

>(Mr. Harris laments the way the Atari8 os is written.)

A minor blemish, as I put it, is hardly lamenting what I also called the best OS by far of any machine at the time. Especially since I'm talking about only one vector set out of the whole OS.

>Now, I said something once about someone providing Mr. Harris
>with some intelligent comments. I certainly didn't intend
>to be the person to do it. But, since Mr. Harris states it is
>his HUMBLE opinion that the Atari8 os should have been done
>differently I'll state my opinion as I see other programmers
>stating it. Those programmers that made direct jumps into
>the OS were not playing by the rules. Essentiall the way
>the os was written was to allow updates to the os while making
>backwards compatibility. I have done a little programming
>and never found the need to make direct jumps into the os.
>Jmp or jsr ciov or sio have worked fine and I appreciate
>that it works on all machines.

You may have misunderstood the intent of the post. The vectors I'm talking about are the ones at $E400, not CIO or SIO which are fine. The $E400 vectors need to be called by having a routine like:

```
LDA $E405
PHA
LDA $E404
PHA
RTS
```

Then you JSR to that routine. If Atari had used the absolute address, instead of using the address -1, then the above routine could be replaced by:

```
JMP ($E404)
```

If they could have used JMP tables, as they did use for CIO and SIO, then you could JSR directly to a supported OS vector, and have no overhead at all.

That doesn't change the ability for updates to the OS, it just makes the vectors easier for the programmer to use.

My point is, that since the $E400 vectors are more clumsy to use than they should be, some programmers were lazy and bypassed them. Even though most people use the vectors correctly, and that's obviously the way it should be done, the fact that some bypassed them is a direct indication that they felt, at the time, that the vectors were too much trouble. This motivation

to bypass them would not even exist, if Atari had chosen one of the latter mentioned schemes. Get rid of the extra trouble, and there would not be any reason to go around the supplied vectors.

I was surprised at myself when I found that the original Jawbreaker used one of the $E400 addresses directly. The newer version of the maze had fixed that code, and of course, the newly rereleased disk has it fixed on both versions.

John Harris - jharris@cup.portal.com

There is also another way to transfer files to the PC. I routinely use the
SIO2PC program to copy Atari files directly to my c:/uue directory where I
then uuencode them and send to friends. The transfer is at 19.2K, faster
than with the 850 interface. I also have the option to use my PC's 5 1/4 with
the UTIL program, but that is somewhat flaky. You can have an SIOPC cable
made for about $50. It comes in handy if you have a spare PC with hard drive.
Make a 16 meg virtual hard drive with SpartaDOS. Create your directories and
there you are. The SIO2PC cable also has a print-thru, so you can print from
AtariWriter to your PC's printer without having to disconnect anything.
Eric

241. Free: Mapping the Atari (you pay postage)

>
I actually ran across one hardware difference. Some games, (Berzerk and
Star Raiders, for example) would run through an init loop in which they
wrote 0 into every location in the $D000, $D200, $D300 and $D400 pages.

I had copies on disk, and when they wrote 0 into $D301, they turned off the OS
ROM, and turned on the Self Test and BASIC ROM. (I think). Either way, it
wreaked havoc, and the system locked up. When the original cartridge was used,
it worked, since the BASIC ROM couldn't be turned on and overlay the game ROM.
I just turned the STA $D300,X instruction into 3 NOP's using DiskWhiz, and
bingo, they started working.

Also, the orignal 800 Space Invaders emits a high pitch whine after you lose
the first missile launcher. This happens with or without the translator. I
never did find out why. I even scoured 4K of dis-assembled code. Oh well.
Deluxe Invaders is better anyway. (IMHO).

Just my two cents...

>Personally, I feel that it is Atari's fault that so many programmers
>cheated like this.

What is interesting to note is that the writers of the software never seem to learn (not all of them <g>). The same thing happened with the ST. Some few companies wrote software that assumed TOS 1.00 would be the only version of the OS <g>. When Atari came out with later TOS's, those apps refused to run. It seems that games are usually worse about this though.

I had a friend who worked for IBM selling and servicing mainframes. He said the same thing happened even there! Programmers would write programs that used "reserved" memory locations, and when IBM upgraded the OS using those memory locations, the old versions refused to work.

It seems that programmers would learn that this doesn't work, but I guess some people just never learn! <g>

>would zmodem be so much different? I know it has a plethora of new, lengthy
>features... but would zmodem be possible in a stripped-down term program?
>Would you need extended memory for... something?

It might be possible, and I have made a couple of queries about it, and noone seemed to know the answer to my question. One of the major setbacks to Z-Modem has nothing to do with memory. Here's the situation.

The 850 took a shortcut to add R: ports. It uses the POKEY chip as a UART. What this means is that while modem activity is going, the SIO port is tied up and can't be used for disk access. Since Z-Modem is streaming (sending data in a continuous stream), the computer needs to be capable of reading/writing to the disk and communicating with the modem at the same time. This just isn't possible with an SIO modem interface and SIO disk drives.

It MIGHT (and here's where I can't seem to get an answer) be possible with a modem port hooked up to the parallel port (MIO and Black Box) and any drive (SIO or hard or floppy through MIO or BB or other parallel int.) to talk to the modem and disk at the same time. The same possibility would exist for SIO modem users if sending the file to a hard drive (or floppy via parallel port) or RAMdisk. This would probably require modified R: drivers and/or software that would take advantage of the capability. The data from the modem would only need to be buffered while disk access was going on.

If you tried Z-Modem with a stock setup (SIO R: and SIO drives), you would have to pause the transfer for saves, or request that Z-Modem resend from a certain point after the save. Either method slows down Z-Modem to the point that the advantages of Z-Modem are minimal (recovery from botched xfers is all I can think of).

If someone knows if this is possible, I would be most interested. I was considering trying to do some of this stuff when I ran a BBS on my 8-bit. I don't really have the time now, but I would still like to know...

> extended Bobterm - 1992 (memory enhanced machines only)

This never did come out, right? I think that's what you were saying. I think Puff gave up on the software side of things. He hasn't updated SuperArc/Unarc, DiskComm, or BobTerm is some time. He was working on the BobTerm XE you mentioned and an UnLZH for the 8-bit, and I don't think either was released. Bob told me the UnLZH was in beta the last time I spoke to him. He also said he had considered ZIP (this was before PKZIP 1.9 came out with Imploding), but

that some of the methods used so much memory that an expanded machine would be required, and he didn't want to field questions like "Why won't this archive extract on my machine?".

> Also, whatever happened to the game-oriented term programs? I had one (or
>so I THOUGHT) that let you play tetris while you transferred files... lost it
>apparently!

That was DeTerm. The game was breakout, and it offered some nice functionality with modular design. Never did use it much though.

>There was a GTERM or somthing that allowed for FULL graphics capabilities

247. Bobterm ymodem bug?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-20 08:23:50 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CJx5zq.KCI@utnetw.utoledo.edu>
Source record: 103428

Just noticed something unnerving... ymodem transfers the size of the original file along with the name, and other handshaking bytes. By the DEFINITION of ymodem, it "trims the extraneous bytes" from the transfer once complete. Bobterm ymodem isn't ymodem. No wonder why I had some incompatibility problems a couple weeks back!!! If you transfer a file that isn't EXACTLY divisible by 128, bobterm will save the padding bytes along with the file! Xmodem did this. Ymodem was designed to correct this AND allow for larger 1k packet sizes (with 128-byte blocks once the remaining "chunk" is less than 1k). Xmodem-1k ONLY allows for the 1k packet sizes. Soon after it's creation, ymodem offered batch transfers, too!

Anyone know of a working ymodem program for the 8bit's? Does Express! have a ymodem option? Amodem does, right? Anything else?

(BTW: kermit for the 8bit's DOES keep the file sizes intact! If you transfer a 375 byte file using kermit from another system to yours, it will REMAIN 375 bytes. If you use xmodem, it will be 384 bytes. If you use "ymodem" on bobterm, it is 384 bytes also... #%@"%!@!' I've just finished testing this one last time to prove to myself that the "ymodem" routine was flawed. Darn it! That was a good program too... I stopped using Express! long ago for incompatibilities in xmodem, now bobterm doesn't have proper ymodem... help!!! Am I doomed to return to Amodem AGAIN! Please, someone suggest a decent term program with ymodem as a bare minimum! If I have to register a crippleware program to get a legit ymodem, I have no complaints! I just NEED a good term that follows the standardized protocal rules and doesn't cut corners!!!)

... umm... Omnicom? I recall users saying they've used Omnicom... I have Omniterm (the old shareware version) with kermit and xmodem. Is ymodem in the registered version?

... maybe I can get by with kermit... anyone have a working copy of the GR.0 scrolling-screen kermit that came out around 1987/88? It would display 80 columns fine, you just had to scroll left and right (which was BLINDINGLY fast) by pressing option keys (or holding to "flip" right and left sides completely)! I think there's another version of kermit (v37?) on the umich archive, but as I recall, it uses the simulated 80-col screens which quickly gets a bit hard on the eyes! I don't mind it much, but the old readable right-left scrolling capability was better. Can you force this v37 kermit into this mode??? Somehow?

-Tim

Does anyone out there have any descriptions of the Newsroom photo formats?
I've written a bunch of graphics converters (GIF, Amiga IFF, ST Degas,
TIFF), and it may not be too difficult to integrate a tail-end converter
to Newsroom (or other graphics) format.

Tom Drake (drake@booz.bah.com) wrote:
: I have heard about a 256K plug-in RAM expansion for the 800XL. Anybody
: know anything about this hardware upgrade, and what the address (both
: mail and e-mail) is?

I've spoken with Rich about the Yorky UG... sounds great! The main thing
that's stopped me from buying one is: PBI. I have an 800 and 1200xl screaming
for some memory enhancements. The Yorky sounds like a fine piece of equipment,
AND is XE-compatible, but works on the 800xl only. I assume you could get it
to work on the 600xl and 65xe also... anything with a Parallel Bus Interface.
The old 800 and 1200xl don't have one. :(

Email him, he's on pretty frequently, and can answer any specific questions
you might come up with! (I've gone through the vax.york.ac.uk address):

8-Bit Gold
79 Sprotbrough Road
Sprotbrough
Doncaster
DN5 8BW
England
tel: (0302) 784642 7pmFri-4pmSun
Net: rg9@{vax,tower}.york.ac.uk
Developer: Yorky 256K, Jawbreaker, Mousekattack

Glad to help,
-Tim

PS: If you have a bit of time after the purchase, let us know here in the
newsgroup how it works out for you... kind of a informal, non-magazine-biased
type of review!

Mike of Fine Tooned Engineering called me at home the other day
and we discussed the buyout of ICD's products.

Fine Tooned has purchased ALL of ICD's 8bit rights, including the MIO.

I was also told that a hardware service center will open right here in
Utah for repairing MIO's, etc.. and that the long-awaited 80 column MIO
card would be released, better than ever.

Jeff, you could try to get a copy of on of the converter programs I mentioned.
One was published in Antic I think (Newsroom Converter?), and the other was
probably in Analog (had MANY graphic formats).

>into this mode??? Somehow?

Yes, the Kermit-65 has three screen modes. One is a bare 40 column atari screen, the second is an 80 column split screen like you mention, and the third is a full simulated 80 column screen. The command is:

```
SET SCREEN-DRIVER
ATARI 24x40 standard E: device
40-COLUMN 24x80 with 40 columns visible
80-COLUMN 24x80 simulated
```

Look at the docs for more info.

From: winston@merk.com
Message-ID: <CJzG7M.87r@merk.com>
Source record: 103440

That is true... the "YMODEM" in BOBTERM does not refer to the actual transfer protocol, but rather, to the packet type. YMODEM is -- in reality -- XMODEM-1K and XMODEM-1K Batch, and not true YMODEM. The packet type called FMODEM in BOBTERM, is -- in reality -- XMODEM-4K. Bob wrote a letter on the nets a while after the release of BOBTERM apologising for his poor choice of terms and trying to correct the misconception. I don't remember whether or not the doc.s were updated to reflect the fact that whenevr YMODEM is mentioned, the YMODEM protocol should --NOT-- be inferred.

As to your question about the scrolling KERMIT. That version of KERMIT is referred to as "ACTION! KERMIT" or sometimes "KERMIT-11" I have the ACTION! source code on disk somewhere, but as I found the program unusable, and I didn't own and ACTION! cartridge, I just archived it and tossed it aside since KERMIT-65 was so clearly superior to it. I'm sure that one of the ACTION! gurus on the network can probably help you out with this one. Anyone?

I don't have the details to the Newsroom "photo" icon format. However, the ICON converter program is written in ATARI BASIC and consists of a "FOR" loop that is about twenty lines long. If someone can find it, they could easily post the code segment in a message. I think that the program is called something like, "ICONVERT.BAS".

P.S. Do your picture viewers also handle ".RLE" format and "MACPAINT" format? (I'm curious....)

263. Kola Pads For Atari (MANY)

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-21 17:36:46 UTC
From: lelie@smail.srl.ford.com
Message-ID: <lelie.19.00119D0B@smail.srl.ford.com>
Source record: 103444

Hi,

A small computer dealer in my area has 25+ Kola pads, still in the the shrink wrap, with Micro-Illustrator (some disk, some cart.) all for Atari. That is the good news. The bad news is; I bought one in Dec., and it doesn't work on a 800 or a 65XE that I have tried. The dealer let me try 2 others, same story. The buttons work, but the pad doesn't move the cursor. The dealer will not give me my money back, but what I really want to know is, does anyone know how to get one fixed. I think the pad is supposed to change the resistance to the normal paddle inputs, but I don't know how it could be "Both joystick and paddle compatible" like the book says.
Also, the owner wants $15 each for a Kola with disc Micro-Illustrator, or $20 each for one on cart. If anyone else would like a few, let me know. At the moment, I could not reccomend them to anyone. But, if I get mine to work...

Larry Elie

Hello Atarians,

I have a load of used 2600 and 7800 systems and cartridges for sale.
Make me an offer on any of it. All price and shipping fees will be part
of the negotiations.

Here is a list of the stuff:

7800 PROsystem with 2 controllers, 1 Star Raider controller

7800 Cartridges: Asteriods, Hot Trick, Food Fight, Pole Position, Centipede,
Donkey Kong Jr., Ballblazer, Galaga, Joist, Volleyball, Karateka, Choplifter,
One on One, Commando, Pole Position II, California Games, Mrs. Pac-Man,
Xevious, Star Raider.

2-Atari 2600 systems with 2 controllers, and 2 pong controllers

2600 Cartridges: Pac-Man, Pele's Soccer, Pitfall, Jr. Pac-Man, ET,
Battlezone, Volleyball.

I would prefer to get rid of all this together.

Give me a call if you want any of this stuff: 708-358-4315 after 6:00 on
any week night.

Thanks

Bob

Nothing official. There are some places that keep Info-Atari8
Digests, which are the Internet mail-list versions of
comp.sys.atari.8bit. The Cleveland Free-Net Atari SIG, for example,
keeps Info-Atari8 Digests for 6 months.

Problem is, the Info-Atari8 Digest has been broken for a couple months
now.

270. Atari 800XL Video Upgrade

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-22 16:29:59 UTC
From: drake@booz.bah.com
Message-ID: <2hrka7$bs4@booz.bah.com>
Source record: 103450

I have an 800XL but have noticed that the video output is somewhat fuzzy. It is even fuzzier when using it in 80-column mode even on a monochrome composite monitor. Compared to the 130XE or the 800, the 800XL video leaves a lot to be desired and I usually operate in 80-column mode most of the time.

Both the 130XE and the old 800 put out very good video. Sharp, no edges, etc.

As I understand it (and all you hardware/video experts say otherwise), the stock 800XL did not have separate luma and chroma, just a combined composite color signal.

So.... How do I "upgrade" my 800XL video so it looks similar to the 130XE? I am looking for the "best" solution. I want the same clean video on my 800 as I have on my 130XE.

Is there a way of obtaining the separate luma and chroma signals???

In addition, can the new Jaguar RF TV/switchbox work with the Atari 8-bit and if so, would it make any difference in the output on a modulated TV signal?? Does it in any way boost the color saturation of the modulated signal? If not, is there a simple way of boosting the saturation, but still maintain the stability of the modulated composite signal?

Thanks!

Tom

Message-ID: <759341909.AA06762@rochgte.fidonet.org>
Source record: 103310

From what I understand, all of the rights on 8-bit product were bought.

This comes from someone who will help market items for fine tooned. He has a team of engineers that have joined forces with him, and they will be taking a look at some items in existence, looking to make inprovements on them.

As I stated on a previous message, start looking for the nearest PRO bbs that networks, for fine tooned will have it's own PRO node, and will have direct contact will all other networking PRO systems. This will allow users to be able to submit ideas, and ask any questions over their local PRO bbs to fine tooned.

Are you able to read a bit German? I have an old diskmagazine called
CSM (it is now PD), where you can find the schematics for a video
amplifier. I tried to build it myself, but it never worked. If you
want to try it, I could mail you a 'DCM'-file of this issue.

Bye,
Jochen

Check out the latest issue of Atari Classics (Dec 93). There's an article
which covers exactly this sort of an upgrade in nauseating detail. I
think what you wind up with is a 5 pin DIN monitor jack on the back of
your machine.

275. 1050 repair/upgrade Q

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-22 19:49:06 UTC
From: Nick.Bensema@launchpad.unc.edu
Message-ID: <2hrvvi$3hl@samba.oit.unc.edu>
Source record: 103454

A few months ago, my USD-upgraded 1050 drive crapped out. Specifically, it refused to believe the drive door was down for some internal reason. (My friend tried to patch together the door mechanism, to no avail.) We just kept getting total boot errors, that scratchy sound a US-Doubled 1050 (at least mine) makes when the drive door is open. It did send that fart sound to the TV when I closed the door, though... weird.

anyway, I now have in my posession a plain vanilla 1050 drive with which I cannot read any of my old disks... well, a few... but none of the important ones (i.e. terminal programs, etc, and without the terminal programs I can't send any software to the atari)

is there a way I can transplant the US-Doubler upgrade to the working 1050? The drive units are identical, I figure I just need to swap some chips. Which ones to I need to switch? or is it even simpler than that?

Even if I just get double density without ultraspeed... I'll be OK.

The following was taken from ZMag issue 133. It's very easy to perform
and provides very nice output once completed (at least it did for me).

Z-Mods

Atari 800XL Split Chroma ModificatAan
by Charles D. Koantz

This easy modification to the 800XL provides a true chroma output to the
800XL monitor jack. It allows the use of "split video" monitors for
sharper images and truer color.

This modification involves installation of one wire to the foil side of
the the 800XL main circuit board (motherboard).

The following warnings are necessary for my peace of mind and your safety.

Modificatian is installed at the risk of the user. Any warranty on the
800XL will be invalidated. The author assumes no responsibility for
damage done during, or by, the modification.

EQUIPMENT REQUIRED:

(1) Screwdriver - Phillips head
(1) Soldering iron & solder
(1) Wire cutters or knife

1. Disconnect all power, TV, stick, paddle, drive, MIO, or other
accessories from the 800XL.

2. Turn the 800XL upside down an your work surface.

3. Remove the six Phillips head screws securing the bottom of the 800XL
to its top.

4. Carefully holding top and bottom together, turn the unit upright.
Position it to the left side of your work surface with the keyboard
facing you normally.

5. Loosen the top, lifting it slightly above the bottom. Flip the top
over to the right of your work surface without disturbing the Plastic

ribbon cable connecting from the right side of the motherboard to the top/keyboard assembly.

6. Grasp the sides of the ribbon cable and gently lift it free from the black connector on the motherboard.

7. Set the top/keyboard assembly aside.

8. Remove the two Phillips head screws which attach the motherboard to the plastic bottom shell. They are located at the rear of the metal shield.

9. Work a finger under the left forward edge of the motherboard and lift it slightly while pressing outward an the right side of the bottom shell near the joystick ports. With a little jimmying, you should be able to work the motherboard free of the plastic bottom shell.

10. Set the bottom shell aside and position the motherboard upside down an your work surface.

11. Carefully note the positions of the ten Phillips head screws securing the top and bottom metal shields to the motherboard. It is important to mark their positions with magic marker or small pieces of tape since one hole is used for another purpose.

12. After marking their positions on the bottom shield, remove the ten Phillips head screws holding the shields, expansion slot clips, and motherboard together. REMEMBER - THOSE SHIELD EDGES ARE SHARP.

13. Remove the expansion slot clip, metal shields, and bottom insulating sheet from the motherboard.

14. Set the motherboard, component side up, an your work surface. The joystick ports should be an the right; the metal R.F. module should be at the rear.

15. Locate transistor Q5. It is the leftmost of three transistors in a row, about two inches in front of the metal R.F. module.

16. The left lead of Q5, viewed from the component side of the motherboard, is where the chroma signal is available. Put a finger over Q5, turn the motherboard upside down, and locate the corresponding connection an the foil side. Verify your choice by holding the motherboard in front of a stong lamp and viewing the connections with the shadow of Q5 visible through the motherboard.

17. Cut a piece of hookup wire to ten inches. Strip one end and solder it to the connector you identified in the last step (an the foil side of the board). Again, make sure this connector corresponds to the left lead from Q5 when viewed from the component side of the board with the joystick ports to your right.

18. Route the free end of the hookup wire straight toward the edge of the motherboard occupied by the R.F. module.

19. About 1/2 inch from the edge of the motherboard, bend the hookup wAre at a right angle toward the five board connections of the monitor jack.

20. The free end of the wire will connect to the monitor jack connector for pin 5. Of the five circuit board connectors, it is the second nearest to the expansion slot. It has no foil lead. (The middle connector of the five also has no foil lead so be careful not to pick it.)

21. Cut off the excess length of hookup wire, strip the free end and solder it to the connector for pin 5 of the monitor jack. Verify the pin by examining the monitor jack pin identifiers printed on the component side of the motherboard.

22. Reposition the top and bottom metal shields on the motherboard. Make sure the insulating sheet is placed between the motherboard and the bottom shield. Check to make sure the new wire exits the bottom shield through the slight elevation in the shield edge near the R.F. module.

23. Slide the metal extender slot clip into place and fasten it and the two shields to the motherboard with two Phillips head screws.

24. Secure the shields to the motherboard with the remaining eight Phillips head screws. These go in the holes you marked earlier (step 11).

25. Retrieve the plastic bottom shell and position the motherboard assembly in it. It's helpful to start the joystick ports into their holes first, then gently sliding the motherboard into place. You may have to bend the plastic shell in the area of the power switch to get everything seated.

26. Once the motherboard is seated in the bottom shell, secure it with the two slim screws you removed earlier. One goes near the power jack, the other goes near the peripheral (SIO port) connector.

27. Lay the top assembly to the right of the bottom assembly with the keyboard ribbon cable near its long black connector on the motherboard. Grasp the sides of the ribbon cable and gently insert it into the connector.

28. Fold the top/keyboard assembly back over the bottom/motherboard. Check to make sure the ribbon cable is not folded sharply or pinched between the top and bottom.

29. Holding top and bottom together, turn the 800XL upside down and replace the six Phillips head screws that hold it together. Do not overtighten the screws. They are anchored in plastic that strips easily.

30. You're done!!! Find a monitor cable terminated with four phono plugs and you're in business.

Radio Shack has such a cable. (If its the same as mine, the plugs are:
BLACK - audio, RED - luminance, YELLOW - chrominance, WHITE -
composite video (unused) with a split video monitor like the Commodore
1702.))

On the chance your cable is wired differently, some experimenting will be
necessary to find the right hookup. Plug the DIN connector end into the
800XL monitor jack. Turn on the 800XL and run a disk or cartridge program
that uses sound and color. (A nice AMS selection?)

a. Find the audio plug by sequentially plugging each plug into your
monitor's audio input jack. When one plug yields the right sound,
MARK IT!

b. Find the luminance plug by sequentially plugging the remaining three
plugs into your monitor's COMPOSITE VIDEO jack (the one an the front
of the Commodore 1702). The jack may be marked simply "video". You'll
know you have the right plug when you get a good picture, but
monochrome (black-and-white). MARK THIS PLUG as the luminance or
"luma" plug.

c. Find the composite video plug by sequentially plugging the remaining
two plugs into your monitor's COMPOSITE VIDEO jack. When you get a
fine color picture, that is NOT washed out, MARK THE PLUG. This
composite video plug is not used with split video monitors like the
Commodore 1702.

d. The remaining plug car!Aes the chrominance signal. When plugged into
your monitor's COMPOSITE VIDEO jack, you should get either no picture
or a very washed-out color image. MARK THIS PLUG as the chrominance
or "chroma" plug.

e. Connect the audio, luma, and chroma plugs to the corresponding input
jacks of your split video monitor.

f. Why are you still reading? The modificatAan is done and your computer
is correctly connected to a monitor. Play DONKEY KONG.

'!Aavsly, if you have trouble, leave electronic mail for me at:
GEnie - CHARLEKOONTZ CompuServe - 74206,3444

277. Re: Wiring d5-d8: anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-23 05:35:03 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CK2I6F.GDG@utnetw.utoledo.edu>
Source record: 103306

Mr. Fixit (timuszyn@jupiter.cse.utoledo.edu) wrote:

:: I recently starting wiring up a few extra drives to run off my Astra drive
::controller. They seem to work fine BUT, I recall several old Atari BBS's pre-
::1988 or so that had disk drives configured as d5 through d8. No, it wasn't a
::ram or hard drive partition... this was accomplished through a minor cabling
::change - anyone know what needs to be "twisted/interchanged/hot-wired"?

: Had a little response, but thought I'd "repost" a clip of the original to
:see if any of our more infrequent viewers to the group missed it... if you have
:any info on the wiring change, please POST or EMAIL me!!! I'm trying to find
:some 34-wire-pinouts of the "standard IBM" drive controller ribbon cable.
: Basically need to know what wire carries what signal, etc... what purpose...

Well, if anyone's actually interested: (for those using an old floppy
drive controller or Black Box and would like to know what signals that old
34 pin monster ribbon cable is carrying to the IBM-type floppies)

Floppy Disk Controller
pin assignment pin incorrect assignment CORRECTION

1 GND 2 Density Select LOW DENS

3 GND 4 (reserved) HL

5 GND 6 (reserved) DS-3

_____
7 GND 8 Index INDEX

9 GND 10 Motor Enable A DS-0

11 GND 12 Drive Sel B DS-1

13 GND 14 Drive Sel A DS-2

15 GND 16 Motor Enable B MOTR ON

DGS Clearance bundles and special offer bundles

==========

We are having a clearout at DGS HQ, and HAVE to get some stuff out of the way because we keep tripping over it! In order to get the stuff out of the way as fast as possible, we have decided to sell it in bundles and as cheap as possible. We now have *2* of the following bundles to dispose of (we found some more of them - it's amazing what turns up when you have a clear out!):

BUNDLE #1 (2 AVAILABLE):

****

ATARI MACRO ASSEMBLER, EASY PROGRAMMING FOR THE ATARI MICRO BOOK, DIGI-STUDIO (OLD PACKAGES 1&1.5. ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM - 2 DS/SD DISKS AND 2 MANUALS), ONE BACK ISSUE OF EITHER PAGE 6 MAGAZINE OR ATARI USER (THE BRITISH MAG.) OF OUR CHOICE.

All the software is BRAND NEW, except the mags which are used.

PRICE: JUST $20 PER BUNDLE

===

THIS PRICE INCLUDES SURFACE MAIL SHIPPING FROM THE UK! (THE PARCELS WEIGH IN AT 1.2 KILOS SO AIR MAIL IS NOT REALLY A VIABLE OPTION. IF YOU WANT YOUR BUNDLE SENT BY AIR MAIL THEN ADD $15 TO THE PRICE).

****

BUNDLE #2 (1 AVAILABLE):

****

AS ABOVE BUT WITH "ATARI 600XL PROGRAM BOOK" IN PLACE OF THE EASY PROGRAMMING BOOK.

PRICE: JUST $20 PER BUNDLE

===

SHIPPING ARRANGEMENTS AS FOR BUNDLE #1

****

BUNDLE #3 (1 AVAILABLE):

****

DIGI-STUDIO (OLD PACKAGES 1&1.5 - ALL SOFTWARE EXCEPT THE NEW LIDS SYSTEM.
2 DISKS AND 2 MANUALS), ATARI 600XL PROGRAM BOOK, A BACK ISSUE OF PAGE 6
MAGAZINE.

PRICE: JUST $15 PER BUNDLE

===

SHIPPING ARRANGMENTS AS BUNDLE #1, EXCEPT ADD $10 FOR AIR MAIL.

****

BUNDLE #4 (10 AVAILABLE):

****

THIS BUNDLE WILL GET YOU SOME CURRENT DGS PRODUCTS AT BARGAIN PRICES!

THIS BUNDLE WILL GET YOU THE FOLLOWING:

* A COMPLETE SET OF NEWS-DISK BACK ISSUES (1-14) ON 7 DOUBLE SIDED DISKS!
* THE RAMBIT/DGS PRODUCT "PRINT-FILER"
* THE "DEMO MAKER" SOFTWARE (COMPLETE WITH 14 PAGE MANUAL)
* THE RAMBIT/DGS PRODUCT "TASKMASTER" (TAPE TO DISK UTILITY)
* THE FULL CURRENT VERSION OF DIGI-STUDIO, WITH 2 DS/SD DISKS AND A 44 PAGE
MANUAL. COMPLETE VERSION 1.2 LIDS SOFTWARE.

THE USUAL COMPLETE SELLING PRICE FOR ALL THIS SOFTWARE IS $75, BUT AS A
SPECIAL OFFER YOU CAN GET ALL THE SOFTWARE LISTED ABOVE FOR JUST
$55 INCLUDING *AIR MAIL* SHIPPING!

===

(THAT'S A SAVING OF $20 ON THE USUAL SELLING PRICES!)

NOTE: WE WOULD RECOMMEND THAT YOU SEND THE CASH BY REGISTERED MAIL, OR BY
USING AN I.M.O (FOR 30 UK POUNDS).

NOTE 2: THERE'S NO NEED TO RESERVE ONE OF THESE BUNDLES. JUST SEND THE CASH
OR IMO WITH YOUR NAME&ADDRESS (AND E-MAIL ADDRESS) STRAIGHT TO US.

****

Ordering info:

First reserve a bundle by email: dx107@cleveland.freenet.edu. I only read and send messages from here once a week at weekends. I'm not ignoring you if I don't reply straight away!

Then send the cash direct to us at DGS. Paying in cash is the easiest way to pay. You can pay by IMO if you prefer but these cost a fortune to arrange.

If paying by IMO, then make it payable in UK pounds, for half the dollar price (slightly different arrangement for bundle #4 - see the bundle 4 info).

Our address is:

DGS

62 THOMSON AVE

BALBY

DONCASTER

DN4 0NU

ENGLAND

Note: It is important that you send your money as soon as we confirm that a bundle is still in stock. We need a rapid turn-around on this stock. Only reserve one if you REALLY want one. We have had problems in the past with people reserving stock and then never paying for it.

Note 2: please note our address now. We won't give it again when we confirm your reservation by email.

We will put your bundle in the post the same day your money arrives. Delivery by surface mail should take about 6 weeks to the US. Delivery by air mail takes about 1 week. We will also throw in a copy of the latest DGS catalogue of PD and commercial software.

The only way I know of getting drives 5-8 is by reburning the Eprom. I don't recall the locations off hand, but I only knew them for 810 & xf551s anyway. I do have a burner so if you find the some suitable drives I'll burn the Eproms for you. As far as I k
now, it would have to be in the controller though.

[Lawrence, please post to all nets, thanks!]

ATTENTION: please download this message & re-post freely to all networks & BBS systems. Thanks!

AC Versus The Winter of '94 (sheesh!)

Hello Peoples,

Today is the first time since last Tuesday I am able to once again send outgoing email coms without them bouncing back to me. Just a small measure of what's been going on here the past couple weeks.

I reserved the period of Jan. 3-10 to put together the February issue of AC & to edit material for the February AC Software Disk. On January 7 we had a nasty ice storm here in southeastern Pennsylvania that wiped out power to over a million homes. Although power to most people was restored within 2 days, I didn't get back my power until late in the evening of January 11. As of Jan. 7 when the outage began, production on the Feb. AC was half-completed & on schedule. I'm sorry to say I've made essentially no progress on the magazine since then.

Living for the better part of a week with no heat/lights/electricity in the middle of the most severe Pennsylvania winter this century was not fun. I didn't shave, wash, or change my clothes for 5 days. I moved into the den & camped out in front of the fireplace, & slept with my shoes on. Precious editing time (part of which was also vacation time from my job) got spent hauling firewood & on long searches for lamp oil, wood & kerosene which were in short supply since I had to compete with a million other people in the same situation as me. I thought I was prepared as I had half a cord of seasoned hardwood on hand, but on the 3rd day the wood ran out (it goes up like tinder in an open fireplace), & panic set in. I got thru the final 36 hours with the help of a friend who gave me some old ratty wood & loaned me a kerosene heater. Were it not for that, my plumbing would have froze & I would have been forced to abandon my home & go to one of the emergency shelters that were hastily set up by the local municipal authorities. I've been living here 13 years & never saw anything like this.

After the power was finally restored (it took until the 12th for the house to warm up agan, my bathroom fell to 35 degrees & the toothpaste froze in the tube), it took me another 3 days to clean up all the mess & begin to resume work on the February AC.

On the evening of January 15, as I was reviewing material for the AC February Disk, an earthquake trashed my office (24 hours before the Big One hit L.A.). I don't know if the Pennsylvania quake made the national news, but I can tell you it scared the dickens outta me. It was only a 4.6 quake, small potatoes

by California standards, but with the floor rolling under my feet, windows rattling, & papers fluttering down all over the place it was plenty scary. I had a whole bunch of manuscripts, subscription forms, advertising copy, checks, disks, notes, computer manuals,& a ton of other paraphernalia related to the magazine spread out all over as I usually do; it all ended up in jumbled heaps on the floor. A freakin' mess! I again gave up work on the magazine to pick up stuff & restore some order, it took several days. A few items seem to have gotten lost in the shuffle of papers. * sigh *

While I was preoccupied with the 2nd cleanup we got hit with the Deep Freeze & another ice storm. Temperature on my back porch: -9 degrees F. Wind chill: -40. On the 16th there was a sound like a cannon shot from my neighbor's yard. Incredible, the trunk of a huge tree in his yard had "exploded"; the sap froze & expanded and blew up the wood. Since then I've been nervously keeping watch on the 40-odd trees growing on my property. I already have quite a bit of minor storm damage accumulating on my property: tree branches down everywhere, damage to the doors & roof of my toolshed, & a 24-foot section of 6-foot high fence that went down in the 'quake.

The Deep Freeze has persisted for the past week, resulting in a big drain of electrical power on the entire Eastern Power Grid. Southeast Pennsylvania, being densely populated, was among the hardest hit. On the 17th the power companies here commenced a series of "rolling blackouts", a phenomenon new to my experience, in an effort to prevent total collapse of the Eastern Pennsylvania Grid. I pushed ahead with work on the Febrauary AC, figuring they wouldn't dare black out my area since we'd suffered so badly during the outage of the previous week. It was sorta like playing Russian Roulette with the power company.

Well, I lost the game. Big-time. On Jan. 18 I was smack in the middle of an editing session & got hit by a rolling blackout. It only lasted 90 minutes, but I lost all the work I'd managed to do since Jan. 7. I'll leave to your imagination what expletives I emitted when the lights went out for the 2nd time in as many weeks.

In the meanatime the 2nd ice storm coupled with the record-low temperatures & a shortage of road salt turned all the roads around here into automobile skating rinks. It's aparadise for car thieves, there are wrecked & abandoned cars everywhere. It also turned my usual 25-minute commute into 2 hours each way. Result: instead of getting home from work at a decent hour & resuming work on the magazine, for the past week I get home late/exhausted/half-frozen due to sitting in monster traffic jams for several hours watching people slide sideways & backwards down overpasses & stuff. The whole past week has been like this, I've made no progress on the magazine at all, I'm still stuck where I was on Jan. 7.

On January 19 the Governor of Pennsylvania declared a state of emergency due to the power crisis & also major problems with broken water mains (due to the combination of severe cold plus the earthquake), in consequence of which all commercial operations curtailed their business activities to reduce power consumption. For me, this caused disruptions in computer systems & telecommunications. As most of you know, the AC Staff relies heavily on these

systems for its existence, as we are scattered all over the North American continent. I've been unable to send messages to GEnie or Internet since the 19th, today is the first day I've been able to get messages through.

This past weekend I've once again resumed work on the February AC, but I've given up all hope of adhering to any sort of schedule. I'm just going to plow along until it's done, however long that takes. The February issue will almost certainly be late. How late, I don't know. I can't afford to take any more vacation time from work for awhile, so I'm pretty well confined to whatever I can accomplish on weeknights when the roads aren't clogged (yeah, right) & weekends. I still have at least four full days of work to do on the mag, which means probably 2 more weeks before I'll have it ready to send to our Publisher for typesetting & proofs.

Assuming the weather doesn't get any worse.
And also assuming our Publisher isn't having the same sort of problems I am.

Please bear with me, everyone, the temperature got up to 36F today & I feel confident enough to guarantee the Feb. AC will get mailed out before July :).

- Ben Poehland
Managing Editor
ATARI CLASSICS Magazine

PS: Postal mail deliveries have been very erratic the past 2 weeks. Yesterday I noticed several mail items frozen in the ice around the base of my mailbox (the mailman couldn't get the door closed & the wind blew the mail out). If I take a pickaxe to the ice these mail items will get wrecked. I've decided to let them remain there until we get enough of a thaw so I can retrieve them without damage. One item is a Letter To The Editor, I could read the address through the ice. The ice is over 3 inches thick.

283. New 2000 thimble wheel;mono composite monitor for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-23 21:26:27 UTC
From: cohen@GOMEZ.phys.virginia.edu

For sale-
NEC series 2000/2050 wide-carriage letter quality thimble wheel printer.
Equipped with the parallel (PC compatible) interface, instructions included.
Note: This is the personal computer model, which is the lighter and smaller
one (NOT the heavy monster model used in big offices).

Also have a BMC (made in Japan) monochrome monitor- accepts composite video
via RCA jack. Very sharp picture, good for 80-column applications,
BBS-ing, text processing, data base or spread sheet applications.
Not recommended for games (except text-based ones like Scot Adams adv.
or Infocom) because it has no color.

I'll sell to a reasonable offer, so please feel free to send your offer to
the e-mail address COHEN@GOMEZ.PHYS.VIRGINIA.EDU.

Thanks!

The pinouts for the drive select signals on the 34-wire Shugart cable are:

drive 0: pin 10
drive 1: pin 12
drive 2: pin 14
drive 3: pin 6, repeat 6!

However, this is drive numbering from the controller to the drives. What you want to change is numbering from the computer to the controller (D1:-D4: -> D5:-D8:). This is a function of the controller firmware and may or may not be influenced by dip switches on the controller board.

No, but I have seen some (old) .RLE viewers, and two or three MacPaint
viewer programs. I think they all decoded to graphics 8, since both of
these formats are monochrome.

As a matter of fact, I grew up with games like AR, Spelunker, Eidolon,
Koronis Rift etc., and don't think there's anything out today that comes
even close to those as far as gameplay is concerned. I haven't touched
computer games for over 2 years now, because I got fed up with looking
at the dull, over-hyped games produced today (with very few exceptions,
like Lemmings). I wonder what happened to all the people who wrote the
`classics' on the 8-bit... Perhaps, if computers were still limited to
64K RAM, and disk drives to 128K, game programmers would still
concentrate on gameplay rather than graphics and (digitized) sound.
(btw., how did you manage to make the sound effects so convincing in
AR - The City??? I've never heard anything like that on the 8-bit
before!)
Anyway, in my opinion, piracy is a result of the policy of game
companies to produce as many games as quickly and cheaply as possible,
with their efforts concentrating on marketing rather than the quality
of the games. Many people who used to buy games will nowdays not want
to pay more money than they used to for much less than they used to get
years ago. OK, perhaps simulations are a bit fancier looking now, but I
enjoyed "Mig Alley Ace" too, without getting (and paying for) a 100 page
booklet about airplanes... The strange thing is, some people must be

buying these dull games, otherwise the game companies would produce them! Probably some 14-year-olds who don't know what else to do with their pocket money and can't resist the advertising and propaganda by game magazines!

Any Comments?

Just my $0 worth (didn't cost me anything :-))...

-MY (wondering what would happen if computer game ads and reviews were forbidden...)

PS: Remember when you could still get interesting games (written in BASIC!!) by typing in lots of pages with DATA-lines from a magazine? (there were a lot of german computer mags around which used to publish games this way - I even got Turbo Basic XL this way...)

>high fence that went down in the 'quake.
>

Luckily , we survived at my place with no major inconvenience, other than walking out of work on Thursday to a flat snow tire (found out on the entrance ramp) which was unrepariable, and _nobody_ has snows left, or is willing to order them for me <sigh>.

How cold was it? Well ... you know that windshield wiper antifreeze that is good to -20 degrees F? I had five jugs in the back of my car, three were froze solid, the other two (different manufacturor) were ok. -22 degrees when I got up at 8 am .. car thermometer had a MIN of -26.2 degrees _inside_ the car ... I figure we might have hit -30 degrees at my house .. wish the kitchen thermometer had MAX/MIN.

The birds are happy though, I've been filling the feeders since Christmas.

A friend at work says we can blame him .. this is his first year to own a snow blower, and a backup generator .. bought this past fall. So he was without power other than the generator for five hours when they couldn't bring them back online after the rolling blackout. And we had 8 inches then 12 inches of snow the last two weeks, 26 inches left on the ground per the NWS. He is glad he hasn't bought a hurricane windsock as yet.

>concentrate on gameplay rather than graphics and (digitized) sound.

perhaps if people bought the software instead of pirating it the 8-bits would still be very well supported, and then you would have all your playable games.

> Anyway, in my opinion, piracy is a result of the policy of game
>companies to produce as many games as quickly and cheaply as possible,
>with their efforts concentrating on marketing rather than the quality
>of the games. Many people who used to buy games will nowdays not want
>to pay more money than they used to for much less than they used to get
>years ago.
So it is the companies fault people pirate games?????????????
I could understand if you said that the games were too expensive, companies were just interested in making megabucks, and people had to pirate them 'cos they couldn't aford to buy them.
Look people who pirate games tend to be thick headed morons who don't realise what they are doing. For every game pirated the company loses money, pirate enough games and the company will not make any money, if it doesn't make money by selling games for the 8-bit then they can't pay the programmers, etc. End result is that they stop making games.... the computer loses support... not good!
Yeah! you may think that one pirated game doesn't make a diference, but it isn't just one game is it? not if everybody thinks that way...
There are still games being produced for the 8-bit today, but in today's market even pirating just one copy can make a diference... the games are of decent quality and the price is low, and yet people STILL pirate them...

>enjoyed "Mig Alley Ace" too, without getting (and paying for) a 100 page
>booklet about airplanes...
my point exactly! you enjoyed it, but you didn't want to pay the price of developing it... something for nothing... things just don't work that way.

Look I'm not trying to have a go at you personaly, but you can't just say that pirating games is all the companies fault, the pirate plays a very big part in it too. Sorry if I ofended you, it was not my intention, I just wanted to point out that pirating is a BIG problem...

All of the above opinions are my own, and just my own... I take full responsibility for them, if you want to flame anybody then flame me!

January 24 Update

Classic Atari Collection Sale
Brian Totty
totty@cs.uiuc.edu

Here is *yet more* classic Atari stuff (mainly games) that I have to sell.
I'm moving in the summer, and I need to find good homes for this stuff.

There are some real classics down there! Many still have original boxes and
documentation! I can describe most of these, if you aren't sure about the
programs. I put a '*' beside my personal favorites.

I think the prices are fair, but if you think the prices are too high, make
an offer. Buyer pays shipping. Send email to 'totty@cs.uiuc.edu' if you are
interested.

uj1g@rzstud1.rz.uni-karlsruhe.de (Marek Tomczyk) writes:

>What is the problem with the Digest? Can it be fixed? If not maybe someone
>else could set up an arbitrary Info-Atari8 Digest.

John Dunning, jrd@stony-brook.scrc.symbolics.com, who maintains the
Digest, told those of us who asked that the problem is with the news
server at the host machine. I believe this is at Northern Arizona
University given the address naucse.cse.nau.edu. That was last month,
and there have been no regular Digests since October or November.

Who knows, it may restart any time, but Dunning has made no announcements.

>If noone can be found, I'd be willing to set something up on my Unix-account,
>i.e. if someone will tell me how to do it, as I don't have very much of an
>idea on how it works. Maybe I could get the mailing software from the
>original Info-A8 site?

The Info-A8 Digest has only worked in one direction, Usenet->Internet,
since its last move in 1989, so I'm not sure we really want that
particular digest software. My guess is that software that performs
Usenet<->Internet crossposting exists out there on the Net somewhere,
but I haven't made a serious search yet.

We would probably need a friendly system administrator to set up a new site
for the Digest. This may be the biggest limitation.

>Any assistance welcome.

I'll ask around for freeware digest-type software, and let everyone
know what if anything I find out.

If anyone here is a system administrator, or can possibly help in any
other way, please speak up!

P.S. Do note, there also exists the Info-Atari16 Digest, which we
might want to deal with as well...

301. Survey!

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-25 05:21:29 UTC
From: drake@booz.bah.com
Message-ID: <2i2a8p$alb@booz.bah.com>
Source record: 103332

Subject: Survey!
Newsgroups: comp.sys.atari.8bit
Summary:
Keywords: Atari 8-bit

Question --

How many of you actually use an 8-bit Atari to access this newsgroup and/or use the full Internet from your 8-bit? No cheating! Let's hear from the REAL 8-bitters! If not, (shame on you!), what system do you use as your terminal/window to the wonderful world of comp.sys.atari.8bit??

As for me, I have a 320K 130XE + (the plus indicating an OMNI ROM with 80-columns, with old OS, new OS and more plus! other stuff!), running two 180K 1050s, a 2000+ sector D8: ramdrive, and the SX212 1200 (Ok, Ok!, I should move up to faster) baud modem in direct connect mode, using the absolutely amazing Kermit65 version 3.7 telecommunications software in full 80-column VT100 terminal emulation mode with the R-Handler supplied by the Bob Puff RVerter program.

(NOTE: If I wanted to, I could still do everything with a 90K 810 or single-density drive, and a 48K Atari 400/800!!!!). Top that!! The Kermit program comes with a software driven 80-column screen, 40-column or scrolling screen, so it can also be used on the venerable 800!).

I access the network from my home and have the Sun Server at work set up so my terminal type is vt100. I have found that the Kermit65 3.7 program works extremely well with the Omnicom running about as well. (If there is better out there, tell us!!!). Or even just a better way..... still tell us!

For downloading or transferring I use the full power of the network to the Sun and then offload or upload via Xmodem (or Kermit!!) to my beloved Atari!

I am running pine as my mailtool, pico as my default editor, and lynx as the insanely cool killer World Wide Web VT100/ANSI Internet network browser with hyperlinking, ALL FROM MY ATARI!!!!!!! Plus more +++++!! I can even do tildas ``````!!!!!!

As my OS, I am using SpartaDos 3.2d and have set up a startup batch file which boots it all automatically with a few other options to include having a dynamically updating date and time which is visible. Then all I do is make a phone call!!

So ALL you 8-bitters out there - come on! - and tell us what you are really using to communicate with the rest of us!

Looking for all setups to access here and the Internet -- the most unusual, the most exotic, the most imaginative, best use of 8-bit technology, the most minimal system (anybody using a 400??!!), the most daring, the most innovative, the funniest, the cheapest, the craziest setup, the most unique, ...

Let's find out how you REALLY access the network to communicate with your fellow Atarians from around the world and share the common, albeit unique experience of the 8-bit domain.

302. ATARI 130XE on CABLE TV!

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-25 05:52:10 UTC
From: ind00052@pegasus
Message-ID: <2i2c2a$o85@pegasus.cc.ucf.edu>
Source record: 103340

Just a tid-bit of interesting stuff:

I was channel surfing through cable television last night and all of a sudden saw a green screen with the "SELF TEST" of the Atari 130XE. I thought maybe someone was playing a joke on me - I checked my Atari - NO, still off - Hmm.... Seems the public access channel uses the Atari to do it's information messages. Nice to see it still being used productively. Now... if they would only just play old classic games 24 hours a day, it might be able to tune in every once in a while.

> terminal/window to the wonderful world of comp.sys.atari.8bit??

I have:
800 XL with 1 MB (MegaRam)
RomDisk
2 * 1050 with Speedy
2 * 3 1/2 inch floppies (HDI)
ARGS-RS232
14400 Bit/s Modem (I use it mainly with my Archimedes - shame on me!)
HP Deskjet 500C
XEP 80 (only used with Bobterm)

My window to the Internet is a HP 9000/730 - it's not my own, of
course!

Bye,
Jochen

The main problem is in the head of those pirates: "Why should I pay
for something which I could have for free?"

I buy software, but I can't say this to other (not Atari-)freaks,
because they normally regard me as insane for this...

The Polish programmers consider this: Polish games are "heavily
protected"!

Very briefly, when I'm at home I use the following ordinary hardware:
130XE (w/ "XE" Touch upgrade)
XF551
XEP80
SX212
P:R: Connection
Magnovox 80-col. mono. monitor

To connect to the local mainframe at the University of Iowa I use
VT850 by Curtis Laser most ofthe time. When I need to upload or
download I use Kermit-65 by John Dunning. I run both programs under
SpardaDOS X 4.20.

The MacPaint viewers I have seen were mostly PD, and I believe all were available on GEnie. Tony Ramos wrote one, and he also had working a printer utility for 9-pin Epson-compatible printers (to print the MacPaint files). You want filenames? If I can find my copies I'll email to the umich archive.

OK, here goes:
I am currently using a 256k 130XE, Indus GT (only drive I have!), Avatex 300/1200 modem (using 1200, of course) tied in thru an 850 interface. I use an older version of K65 (I don't remember which one) in the UGLY bitmapped graphics "80 column" mode. I haven't done any file xfers using kermit, because I am hesitant to xfer any files at 1200 baud to a floppy drive. I connect thru The World Public Access UNIX, and thru The Village of Cambridge (MA), and I have a FREE email/usenet account on a local, 3-line 386-based UNIX system. This is ALMOST the minimal system... the 130xe I am using is a loaner. I WAS (and will be again) using an 800 with Axlon-type 1Meg ramdisk (flaky, doesn't let me use the R: handler, so I don't use the ramdisk) with 48k of RAM, and all the other items I mentioned previously. I DO have a 400, but it is closeted...

I wouldn't mind some pointers on how the HECK to set up Omnicom! It says I'm supposed to append the R: handler to the Omnicom.obj file, but i can't do it, for some weird reason...
BTW, I am using MyDOS 4.2 and 4.5 (my K65 is on a 4.2 disk, and everything else is on MyDOS 4.5).
OK, I guess I qualify as a REAL 8-bitter, huh? (g)

Currently I'm using a stock 130xe hooked up to a 10 meg hd through
a 256k MIO running under SpartaDos 4.21. For the most part I use
OmniCom, K65 and Bobterm (flip between all of 'em) the handel the
various systems I log onto. I've got a 14.4 Intel modem hooked up to
the system for ld calling. The system is connected to 2 usd 1050's, 1
Indus and 2 360k drives through an ATR8000. There is a second 130xe that
I use from time to time that has one meg on board and is hooked up to
a BB/FB with 1 usd 1050, 1.4meg 3.5" and 10 meg hard drive... Have to
move the modem between the two system, else one is limited to 2400
using a Prac. Perph. Fax modem.

I've got about 4 other systems just setting around, mostly 130's and 800xl's.
though I did just pick up a 1025 printer, i dont think I'll get rid of
the Seikosha...

And yeah, I use the Atari all the time... I've got 2 386's and a Mac +
that havn't seen power in a month...

Mike

From: jomcgow@eis.calstate.edu
Message-ID: <2i5hjm$m4f@eis.calstate.edu>
Source record: 103350
Body handling: Inline uuencoded payload not displayed: D:BRKOFF.COM

For those who use Kermit 3.7 and hate the "screaming Qs" that occur when you accidentally hit the break key, the following UUEncoded data is for a short (trivial programme) called BRKOFF.COM:

----cut here and UUDecode the following----

```
table
!"#$%&'()*+,-./0123456789:;<=>?
@ABCDEFGHIJKLMNOPQRSTUVWXYZ[\]^_
```

[Inline uuencoded payload not displayed: D:BRKOFF.COM]

----cut here----

The following is the assembly code (in case you do not have UUDecode, you can just assemble this):

```
10 *= $6000
20 LDA 16
30 AND #127
40 STA 16 ;kill BRK interrupt
50 STA 53774
60 DUM RTS
70 *= 738
80 .WORD $6000
90 *= 736
0100 .WORD DUM
```

(the use of the dummy start address means that this code can be run either from a batch file in spartados OR can have another file appended to its end, say for MyDos)

When I use Kermit (sometimes I use it instead of OmniCom) I use a batch file for sparta with the lines "BRKOFF" before loading my RS232 handler and then KERMITNR (NR=version without the built in handler).

As the file is designed to work under the INITAD (with a dummy STARTAD), one can use it with other DOS (or even sparta) by appending other files to its end (in case you do not use Sparta... the problem with Sparta is that it always sets a RUNAD... first address of the load if you do not set it yourself... so generally folks do not run stuff under INITAD only, which means one does not have programmes permitting append... using INITAD to run and killing RUNAD with a DUMMY RTS makes the programme useable in both Sparta batch and append for MyDos or AtariDos).

This programme can be used to kill the break key on other programmes
which do not do so.

With regards to OmniCom... could never get it to work right under any
but SpartaDos for some reason! And, as most systems I call do NOT
accept XON/XOFF I had to disassemble it and NOP out the XON/XOFF code
(if anyone is interested I will post the patch for this... a small set
of bytes to be appended to the OmniCom code which simply enter NOP
bytes over the XON/XOFF code before running).

> developing it... something for nothing... things just don't work that way.
FYI, I *did* pay for Mig Alley Ace... Don't know where you got the impression
I didn't. I have dozens of original games for the 8-bit (unfortunately I can't
play them, since my 130XE is dead), but not nearly as many for the ST. (which
doesn't imply that I have pirated games - remember, I haven't played any
games for a long time...)

> Look I'm not trying to have a go at you personaly, but you can't just say
> that pirating games is all the companies fault, the pirate plays a very big
> part in it too. Sorry if I ofended you, it was not my intention, I just wanted
> to point out that pirating is a BIG problem...

I insist, that in the good old times people weren't as motivated to pirate
games as they are now - Look at the crap you're getting for your money today!
Agressive marketing and advertising - and of course the exaggarated reviews
in magazines - are very convincing, but once you buy a game you find out that
after 5 minutes it's starting to get boring. The logical consequence is that,

since you can't believe neither the magazines nor the advertising, next time you'll want to try a game out before you pay for it. Unfortunately, this can become a habit, and that's where piracy starts.

Here's an example: I bought "Maxon Pascal" for the Atari ST, for what seemed a lot of money at the time (it's not a game, but a Pascal compiler). It was advertised as being able to compile "most Turbo Pascal 5.0 programs", and since we used TP for some courses at the University and I didn't have a PC, I decided to buy it. To my surprise, it couldn't even compile things like

```
const A = 1;
B = A + 1;
```

Which hardly any Pascal compiler can't. It also couldn't compile some of the examples shown in the on-line help system (like in TP, if you know what I mean). So it turned out to be a waste of money. If I had had the opportunity to try it out before, I could have saved a lot of money.

So, in my opinion, the only way to fight piracy (if any) is, to give away demo versions of programs for free - companies shouldn't expect users to be honest if they aren't. It doesn't work.

-MY

324. SIO2PC Help

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-27 00:31:30 UTC
From: palm_erd@csusys.ctstateu.edu
Message-ID: <1994Jan26.193130.1@csusys.ctstateu.edu>
Source record: 103207

I'm looking for people who have the SIO2PC interface. I bought mine from the author about 2 months ago. I wanted to know how much success people are having with with large disc images, like 2 megs or more. I'm having problems with timing out after long sector jumps. I'd like to be able to get SpartaDos 3.2 (which I have to get, as my copy is dead) to format a 16 meg file and have all my utilities, word processor files, etc in it. Right now, all I've done is copy most of my discs to images. Even though MyDos is not as fun to use as SpartaDos, it's free. Does anyone have SpartaDos for sale? I'd like to get the full set of disc utilities for initializing large partitions, etc.
Eric

325. Powering 8bit peripherals by using hard drive power supply

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-27 02:10:55 UTC
From: KAMARO_KID@delphi.com

I just started reading this thread... I haven't used my Atari 8-bit computers for anything useful in the past seven years or so. I'm REAL intrigued by what I've been reading in the Survey posts...

In article <19940126.21202439.kamaro_kid@delphi.com>, <KAMARO_KID@delphi.com> wrote:
>I use the following 8bit Atari hardware:
>
>1meg Newell upgraded 130xe (with AC Super Video&Audio and FREEZER)
>275meg hard drive via 256k MIO

How did you get this setup, and what exactly does it entail? And what software do you run?! I can't conceive of 275 MB on an Atari 8-bit...

Also how costly was it?

>Hayes Ultra 9600 v.32 modem
>XEP80 (with Bobterm)

Is this an 80-column setup? Does it look good?

>XF551 disk drive
>Indus GT disk drive
>Commodore 1702 monitor (split chroma/luma)

I always used this monitor (2, actually, on separate machines). What do you mean by split chroma/luma?

>Goldstar 12" monochrome monitor (for use with XEP80)

Is this necessary or does the 1702 suffice?

>4 slave multiplexor
>
>Makes my NCR 386 look like crap! [grin]

Makes me jealous, and I just bought a DX2-66 with a 2x CD-ROM, two soundboards, and a 513 MB hard disk! :)

Best regards,
-JRL

Why do you care about what they say ? Just wait until they get busted!
Then, you will be the lucky guy :^))) !

>The Polish programmers consider this: Polish games are "heavily
>protected"!
Programmers in the *entire* *world* have considered this problem again and
again :^) ! Also, I wouldn't say that the Polish games for the Atari 8-bit
are heavily protected :(. Some of them don't even check if there is a
TURBO FREEZER (a hardware freezer) connected to the 8-bit ! BIG MISTAKE !
I *guess* that about 90% of these games are already available as copies
:((((!

Let's face the facts: a copy protection will be removed by pirates within
a few days time or maybe just in a few hours, depending on the quality of
the protection. Companies invest a lot of time and money in creating nice
protections - but why ? Just to be a few days ahead ! Is it really worth
it ? Well, that's something the companies have to decide for themselfes!
Anyways, have a look at the PC market where you won't find any disk
protections AT ALL and this market is still growing ! To say it in just
one sentence: Those who buy software will buy it with or without a
protection and those who copy software will copy it as soon as somebody
removes the protection. Maybe one should stop using copy protections
then??? Anyway, for the ATARI 8-bit it is too late !

erm... we ARE talking about the 8-bit aren't we? I mean I am in the c.s.a.8 newgroup aren't I?
There have always been pirates, there always will be, no excuse... some people actualy ENJOY ripping off other people's work. Copy Protection for example, companies put copy protection on their games, and then pirates go and crack it and distribute pirate copies...
I agree with you in that there is a lot of hype in today's market for the more 'popular' machines, but I'm talking mainly about the 8-bit Atari here. I can't remember the last time I saw a game in the 8-bit world get a lot of underserved hype...

>So, in my opinion, the only way to fight piracy (if any) is, to give away
>demo versions of programs for free - companies shouldn't expect users
>to be honest if they aren't. It doesn't work.
again, not very practical for the 8-bits... you give away demo copies and people STILL don't buy the games, so what's the point? There are people who play the demo version of the game, and then go out and get a PIRATED copy so that they can play the full version... I ask you!
And then there's those who get a pirated copy to 'see what it's like' they play it, like it, but never bother to buy a legitimate version...
Not everybody does this of course, but enough people do it for it to be a problem... So how do you solve it?

Raphael Espino -rje@cs.nott.ac.uk - All the above comments are my own, and just my own, and I take full resposibility for them!!!!

>
>Any docs or assistance GREATLY appreciated.

Any component which uses only +5V (like the XL and the XE) can be
easily plugged into a PC power supply. The +5v and ground signals
can be taken from any floppy drive power cable (the 4-pin molex
connectors). There are two ways you can do it. Either make a
short jumper cable with a 4-pin molex plug on one end (to plug into
the floppy power cable) and a 7-pin DIN (I think it's 7 pin - it's
been along time) on the other end to plug into the computer. The
other way is to cut the molex plug off one of the power cables and
solder the appropriate 7-pin DIN directly to the wires coming from
PS.

Because of the nature of most PC power supplies, you must leave the
ON/OFF switch on the computer turned to ON and power it up using the
switch on the PC PS.

I own neither a 1050 nor an 850, but I believe their power supplies
deliver 9V AC, making it nigh on impossible to use a PC PS with them.

I currently have my 800XL, 2-5.25 inch floppy drives and a 40MB Quantum
hard drive all plugged into the same power supply, inside a PC case. My
next project (should I get time), is to wire my Black Box to the PC PS
as well - it's currently running off it's own PS. Since the BB only uses
+/- 5V and +12V, and since those are all available from the PS, it should
be a simple matter of making the proper cable connections.

The 9 volt power supplies are AC supplies, _NOT_ DC.

One would have to check schematics to determine what could be used to
replace it, and it would vary from device to device. Some (for example,
800 and 400 for sure) had negative supply voltages in addition to the
positive supplies, hence the reason for an AC supply. Also, in general,
+12 volts was probably also used in the circuitry, which could be pulled
from the rectified 9 volt nominal (9 volts rectified and diode dropped
would be about 12 volts or so).

Off the top of my head (I'm too tired to check details tonight), the old
DRAM used in the 800/400's would have used +12,+5 and -5 volts DC. The 850
may also have used -12 for the RS-232 converters. I do not recall which
negative voltages are available on a PC supply, I would guess just the -12.
A -5 volt regulator would easily derive the -5 from that though, I don't
think much current is required. One thing though, most PC supplies
don't put out much negative current, as I recall the rating is typically
1/2 amp on the negative supplies. I would want to throw an ammeter in
one the test bench and measure it, just to be sure I wasn't on the hairy
edge of failure.

I would just open up the case of one of these units ... trace out the
the wiring from the AC in jack, look for the filter caps and regulators,
measure the voltages on the caps, check the specs on the regulators,
and figure out what I could get away with. Then I'd drill a half inch
hole in the case, run wires thru to the circuit board, and make my own
connections to a convenient connector of my choice (probably a disk
drive type if I could get away with just +12 and +5, which could be
possible if one added an approriate surplus +V to - V converter chip).

I think there are more groups than crackers and people buying
software. I know many people who aren't able to crack a game, but who are
spreading unprotected software without thinking.

One interesting fact ("Anyway, for the ATARI 8-bit it is too late !"):

'Operation blood' was sold 100,000 times in Poland (one houndretthousand
times) :-)

Keep in mind, James, that the +12V the transformer puts out is
DC and the 9V input is *NOT* a +9V but 9VAC. This makes the job
a *LOT* more work.

I am looking for the following games for my Atari 8-bit. If you have a copy you no longer use and need some cash, sell it to me!!

Also, if you have any cartridges not on this list, I may be interested as well. Drop me a line.

A.E. Air Support
Attack on EP-CYG-4 Barnyard Blaster
Blade of Blackpool Bounty Bob Strikes Back
Candy Factory Captain Beeble
Chicken Commando
Countdown Crime Busters
Crisis Mountain Crossbow
Crosscheck Dallas Quest, The
Dark Chambers Desert Falcon
Diggerbonk Dodge Racer
Excalibur
Floyd of the Jungle Gato
Getaway Ghost Encounters
Grog's Revenge Gruds in Space
Guardian of the Gorn Into the Eagles Nest
Jeepers Creepers Kid Grid
Laser Gates Load Runner's Rescue
MidiMaze
Moon Shuttle Mr. Do's Castle
Phantasie Phantasie II
Pie Man Powerstar
Prisoner II Puzzle Panic
Quasi-moto Reptilian
Repton
Scraper Caper Sea Chase
Skywriter
Slam Ball Space Shuttle
Spare Change Star Trek
Stone of Sisyphus Sub Commander
Survivor Threshold
Thunder Fox Track and Field
Wing War Winter Games
Xenophobe

This is a reply to Jochen Scharrlach's latest message in which he refers to Poland and 'Operation Blood'. Unfortunately, my server deleted his article before I could send a follow-up :(so I will have to try to remember what he said ...

I think he said something like "Operation Blood was sold a hundred-thousand-times in Poland". Now, that's nice :^) ! However, we don't live in Poland, do we ?! It may very well be true that Poland is a boosting market as far as ATARI 8-bits are concerned but this really doesn't imply that the markets in both Western Europe and North America are doing well. On the contrary, the Atari 8-bit market has been steadily going down for a few years now (Is there anybody out there who denies this :^) ?). Here (Europe + USA), an increasing number of 8-bit users decides to drop the 8-bits and to buy a PC. That's a fact nobody can refute ! I know that it is different in Eastern Europe but that's a whole different story as far as computers are concerned !!!

BTW: When I said "For the ATARI 8-bit it is too late" I was referring to the fact that hardly any new software comes from the Western Hemisphere. All right :) ?

"I own neither a 1050 nor an 850, but I believe their
power supplies deliver 9V AC, making it nigh on
impossible to use a PC PS with them."

I have a 1050, and like the XF551, it uses a 9VAC external power pack.
However, inside both the drives, this gets converted to +5 and +12
volts DC. One could identify where these voltages emerge from the
internal rectifying/regulating section, isolate it, and inject the
appropriate voltages at that point.

In fact, if anyone does this for various Atari peripherals, it would
make a nice article for AC, don't you think? <grin>

"maybe I'll have to create some form of mini transformer
to drop +12v to +9v.."

Wouldn't work. As someone else pointed out, the 9V Atari power paks
output AC, and you are talking DC. The only alternatives I see are
bypassing the internal circuitry that converts this down to the
needed DC voltages and regulates it, or using one large 9VAC transformer
to power all the peripherals that expect a 9VAC input. The former is
a more involved procedure, while the latter would likely be more
expensive (i.e., seen many large output 9VAC transformers lately?).

"Nit .. but someone might buy plugs sight unseen ... they
are DIN plugs, not Molex."

Nit to your nit; if you check this thread, you'll see the original
message by Mike Jewison mentioned both Molex *and* DIN plugs; the DIN-7
being used by the XL series computers for power input, and the molex
being the type of connector found on many switching power supplies.

However, Kamaro_Kid's message doesn't exactly make it clear that the
molex connectors to plug into the outputs of a switching PS were
actually what he purchased, as he made no mention of the DIN plug(s)
he would also have needed.

About the only advantages I could see to building a molex-to-DIN cable
(vs. simply lopping off the molex cable and putting the DIN in its
place) are: (1) If the power supply goes belly up, installing another
one is a plug-n-go affair. (2) Given the shortness of many switcher
power output cables, and extension might be needed anyway.

My problem is that that the last time I checked at Radio Shack, it
appears they do not carry an in-line molex "drive" power connector
by itself (except as part of an extension or connector conversion
cable), which would make me think he actually did purchase a DIN-7
instead, except for the that I don't believe RS sells those either!
<grin>

"What do you mean by split chroma/luma?"

Split chroma/luma is essentially the same as what is currently referred to in video circles as "S-video". Essentially, it separates the luma (brightness) signal from the chroma (color information) signal. This results in increased bandwith potential and reduces crosstalk interference, which results in a sharper picture being delivered to the screen.

">Goldstar 12" monochrome monitor (for use with XEP80)

Is this necessary or does the 1702 suffice?"

A 1702 would "suffice" if you fed the XEP80 output into the luma jack on the back of the monitor. However, the 1702 was never intended as an 80-column monitor, and it's phosphor dot pitch is too large to properly resolve the XEP-80's 640 horizontal pixel output. In plainer terms, you can read the display, but it will be somewhat "fuzzy".

Monochrome monitors, of course, have a solid phosphor face (essentially ".00mm" dot pitch <grin>), and therefore their horizontal resolution is primarily limited by the video circuitry itself (i.e., how fast the scanning electron beam can be turned on and off).

To use a XEP-80 and Atari 8-bit on a 1702 monitor, you would need some way of switching the inputs. One way would be to feed the Atari 8-bit inputs into the front composite video jack, and the XEP-80 into the rear luma jack, and use the 1702's back panel switch to select between the two. However, if you want to use separated chroma/luma outputs from your Atari 8-bit, you will need a different solution.

One method I found is to use an inexpensive stereo audio switch. Feed the luma from the XEP-80 into the left channel of source #1. Feed the luma from the Atari in the left channel of source #2, and the chroma into the right channel of source #2. Connect the left channel of the switch's output to the luma jack on the 1702's back, and the right channel to the chroma jack. Hitting the "source #1" switch will give you XEP-80 B&W video, and hitting "source #2" will give you the color Atari 8-bit video display.

Of course, some will caution that using an audio switch might degrade the display, but in my experience, I found no detectable signs of this. There are video switches available, but there are three problems: (1) They typically switch only one line at a time (and you need to switch 2 to handle chroma & luma). (2) Most use coax connectors for RF video instead of RCA jacks for baseband video. (3) They are typically more expensive than stereo audio switchboxes.

If this is merely a temporary operation, just get a null modem adapter
for your existing modem cable. Set both machines to transmit at the
same baud rate, use the same protocol and upload/download 'til you're
tired!

One thing I've found that makes it real easy is to have a BBS program
running on one of the computers, so everything can be done from one
keyboard...

Now that Western Design has come out with the Static version of the 65sc802 chip, has anyone tried it? You should be able to just pop it in without any support chips or modifications. The reason the old version didn't work was because of the cycle stealing method antic uses to halt the 6502 by holding the clock line would destroy the registers.

I don't have a good memory of the stock at Radio Shack, so pricewise
I don't know what is cost effective there, but I tend to pick up
disk drive Y cables at flea markets, then cut the wires and use
the three connectors (two jacks, one plug) separately for adapting
power supplies to disk drives, adding disk drive connections to existing
equipment, etc. I can usually get Y adapters for about $1.50 or so,
so I figure 50 cents a jack (and I don't cut them apart til I use
them, so I can use them as Y adapters if I need one).

Actually, the PS style power supply connector IS a MOLEX connector.

The connecter to the 8bit computer is a DIN connector.

Actually, I had two dead XL/XE power supplies, so I simply cut off the DIN/OUTPUT cable and put a MOLEX connector on the other side..

I then just plugged that into the PC PS and fired everything up.

Radio shack does indeed carry 4pin MALE/FEMALE MOLEX connectors that fit snugly into the FEMALE connectors found in PC power supplies. -- at least they do here in Salt Lake City

:
I'll add my $.02 worth here...

Although many Atari power supplies put out AC, this is rectified and regulated internally to the desired DC voltage. If the external brick puts out an AC voltage, you can often use a DC power supply in its place. If you put it in the wrong way, the rectifier blocks all input voltage, and vice versa, in the right polarity, the rectifier passses all input voltage. In other words, plug it in momentarily, if nothing happens, unplug it and reverse the polarity and try again.

As for dropping the input voltage from 12v to 9v, the external bricks are typically unregulated for the Atari peripherals. Pick up a couple rectifier diodes and put them in series on the + side. Each diode will shed about 1v, and output it as heat (the higher the current, the more heat).

I once threw away my one meg MIO boxes 9vAC external power brick, and powered it with a 12v motorcycle battery and a 1amp trickle charger. I dropped the voltage as above. It was tough on the battery, but I never lost my one meg RAM disk in the two years I used it due to a power outage.

I use whatever's handy at the moment. Usually I use my Amiga and up until last night a SupraModem 2400. It's been cold in my computer room lately (it's over the garage and I live in Rochester, NY), so I dragged out a circa-1982 VT100-compatible dumb terminal and have been telecommuting from my living room (it's strange to read the Net and watch TV at the same time) lately. Last night I replaced the SupraModem with a brand-spankin'-new Zoom 14.4K 4.2bis FAXmodem which I will probably seriously underutilize most of the time. When I'm at work, I use a medium-sized VAX system and can dial out on an identical Zoom modem connected to a serial port in another room. I have in the past used my Atari 800XL running Kermit, at baud rates from 300 up to 2400, and various portable terminals and jury-rigged this-and-that while "on the road."

I have the following Atari 8bit hardware items for sale or trade:
==========
Atari 810 disk drive (TANK!)

Percomm Data Disk drive w/printer port, and green controller card (can run
360-1.2 meg floppies)

MPP 1000E 300 baud modem (no power supply)

2 x 1027 printers (only one has a power supply)

Okimate 10 color thermal printer w/ 3 ribbons and 4 rolls of thermal paper.

Atari 1020 printer/plotter (40 column) with power supply.

Atari TrakBall

2 x 1050 (stock) disk drives with power.

Indus GT disk drive with power.

2 x stock 130xe's (no power supply and both have DEAD function keys (HELP,
START, SELECT, OPTION, RESET).

ADC SmartModem 1200 baud Rs232

Hayes SmartModem 1200 baud Rs232

Atari 2600 video game machine with power supply.

XM301 300 baud direct connect modem (in original packaging)

Best offers on any above listed items.. But I PREFER trades rather than cash.

Email me at: jking@email.state.ut.us or kamaro_kid@delphi.com

>How did you get this setup, and what exactly does it entail? And
>what software do you run?! I can't conceive of 275 MB on an
>Atari 8-bit...

I installed the 1meg of ram myself - using the Newell 1meg upgrade
kit (still obtainable). As far as the 275meg goes - I'm using
bank switching with my MIO.. I simply load in extra 16meg partitions
as they are needed.

>Is this an 80-column setup? Does it look good?

Yes.. The XEP80 allows for full 4800 baud 80 column viewing. I do all
my non-8bit modeming and word processing in 80 columns via the XEP80.

Quite nice.

371. Re: Pirating, was Re: DATASOFT -=> Alternate Reality

what bugs me is why people even bother discussing the issue of piracy as it applies to Atari 8-bits. You simply CAN'T BUY much of the software anymore! and if you do, it will be used... and company X will still make no money.

They should make a law where if you don't make money on a product for X amount of time, it's free. or, if your company refuses to sell a product, it gives others the right to make duplicates of it for free.

WHAT DOES ATARI HAVE TO LOSE IF I DOWNLOAD STAR RAIDERS INSTEAD OF BUYING IT? WE HAVE EVERYTHING TO LOSE. WE HAVE NO ALTERNATIVE!

as for PC's, some people pirate because they don't want to deal with those stupid codebooks that use microsscopic text that is so faint, or on such dark paper that it's impossible to read by a photocopier, OR you. but then again, it's harder to get pirated PC stuff... they aren't in PD games sections sometimes like I've seen on Atari and Commodore boards.

372. More drive problems

Newsgroup: comp.sys.atari.8bit
Date: 1994-01-30 03:18:37 UTC
From: Nick.Bensema@launchpad.unc.edu
Message-ID: <2if8ud$28a@samba.oit.unc.edu>
Source record: 103252

Someone here told me how to swap the US Doubler chipsets.... and we got them out... but we had to remove the drive mechanism to remove the shielding under which they were hidden.

Actually, we never removed the chips... we tried swapping the drive mechs between drives first, and tried each drive. Neither worked.

We then re-iinstalled the original drive mechs with their respective circuit boards, and found out that the drive which once worked, now did not.

Our theory is that we put them back together wrong, even though my friend says they were numbered so he couldn't do it wrong (I had him do it because I'm visually impaired.) ... i figured it would be pretty easy to screw it up because they had four sets of wires leading to the same cluster of pins, where one big plug should have gone instead of this...

anyway, has anyone else run into this problem? did we whack the drives out
... dangit system shutdown.......
brb for details

According to the docs it is "freeware"; actually, modifications
are allowed and that would make it PD.. The author only
requires that source code be distributed.

Bob Puff's last version was 4.50, the 4.53 version I've seen
says it is a modified 4.50....

>

Hmmmm ... technically no .. assuming a full wave rectifier in the supply circuitry inside the individual units ... the ground level would be slightly different from one unit to the other, and connecting the grounds together would cause AC rectifier current to add noise to the interconnections and shift voltage levels.

BUT ... it just might function adequately. As in ... voltages might shift enough that regulators don't _quite_ regulate, but the logic may still work. Worst problems might be in the analog circuitry .. noise in audio and video. Then again .. as a disclaimer ... it would be feasible for the ground potential to shift enough to damage something. I would hook up all the units to the supply with no other interconnections at all, and measure ground voltage differences, and ground current as I hooked up each unit together. And then check the internal voltage rails to insure adequate margins for the regulators.

If the goal is to cut down on power module though, I would be more likely to measure the required current for each unit, and buy a separate 9 volt transformer as needed for each, mounting all of them in one box with one power input lead, and power outputs labeled as rated for each transformer.

:
: "maybe I'll have to create some form of mini transformer
: to drop +12v to +9v.."
:
: Wouldn't work. As someone else pointed out, the 9V Atari power paks
: output AC, and you are talking DC. The only alternatives I see are
: bypassing the internal circuitry that converts this down to the
: needed DC voltages and regulates it, or using one large 9VAC transformer
: to power all the peripherals that expect a 9VAC input. The former is
: a more involved procedure, while the latter would likely be more
: expensive (i.e., seen many large output 9VAC transformers lately?).
:

In these previous article to this one, the author stated that the AC
was directly
converted to DC. I also believe this to be true (haven't checked lately
though). Anyway, a little background on rectifiers is needed here
A rectifier is used to convert AC->DC, HOWEVER if DC is applied instead
of AC, DC voltages are still produced. This DC output is about 1.2V
lower than the input, though. This is then regulated and filtered.
This article states that the rectification circuitry would have to be
bypassed. This is incorrect since DC->DC in the rectifier. The person
just has to be sure to overcome the ~1.2 V drop.

>

Well, for the longest time, I accessed Internet (from the begging) via a UseNet feed sight called Cyberden which is near where I live... I used my trusty old 1200xl w/64k and 127k 1050 drive and sx212 1200bps modem.. since then I have upgraded to 1200xl with 256k and another drive, BUT, unfortunately, I then accidentally fried it a bit to the point where R: and P: are nearly meaningless to it :(... so, I was back to the 48k machine and two floppies (one of which started acting up - seems as though the SIO port is "loose"!?)

Anyways.. THEN, I somehow messed up my old 1200xl :(and now Im not sure that it actually works at all any more.. I haven't booted it in a few months. But, I still had my good old Dumb Terminal .. with a broken keyboard <sigh>, so I was download-less.

Now, I have a PS/2 at home to play with (8088 or 8086 or something! yikes!) and can use my 2400bps modem with it, and download and upload and all that good stuff..

BUT.. Cyberden is going Subscription and I have little money to be putting out to BBSing! So, I guess I'll end up calling this VAX system with the PS/2, and if I ever get a BlackBox, 850, or P:R:Conn, I'll probably start BBSing with the 8bit again ... or at least setting up MY OWN BBS every now and then.

So, yes, I >DID< use my 8bit to access comp.sys.atari.8bit, but now Im on a Mac Centris 650... :) And yes, I >DO< like it! NYEAH!

But Im never ditching my 8bits!

396. RTime8-Cards for sale anywhere?

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-01 09:01:36 UTC
From: wi40756@rz.tu-ilmenau.de
Message-ID: <2il5pg$o8@prakinf2.PrakInf.TU-Ilmenau.DE>
Source record: 103373

Howdy folks,

since quite a long time, I've been looking for one or two RTime8-cartridges.
In Europe, there is nobody, who can sale or send me one of these Cards.
Please tell me, how I could get one or two of these. It doesn't matter,
if it is used or with an old battery.
Please tell me about it!

Many thanx from Germany

Hendrik

That's not what I said. I was wondering who bought *and* enjoyed the
crappy games that are being produced nowdays.

> >-MY (wondering what would happen if computer game ads and reviews were
> >forbidden...)
> EASY ! Both software and hardware markets would TOTALLY go down !!!
So you think advertising computer games is necessary to make people buy
software and hardware? Perhaps you'll find it unusual then that I've
never seen an advertisement for computer games on a SparcStation, but I
still bought one (well, I saw an ad for Sim City, but after I bought
the computer). And I do have some games for it now (all X11-based, and
PD/COPYLEFT). When I bought my first 8-bit Atari, I did it because I
already had a 2600, and wanted to do some programming (so games weren't
the reason). And I got the 2600 from my parents, after having seen it
in a shop (no game ads involved there either).

> >PS: Remember when you could still get interesting games (written in
> >BASIC!!) by typing in lots of pages with DATA-lines from a magazine?
> >(there were a lot of german computer mags around which used to publish
> >games this way - I even got Turbo Basic XL this way...)
> Well, I do remember those times very well but I can't see your point.
> Sorry :^) !
The point is, that even those games were often fun to play, despite
their size of usually around 10K of code + graphics. Compare that to
some PC games that are *not* playable. (plenty of them, as far as I can
tell - without having a PC. IMHO).

-MY

|> I know the SIO port uses some sort of synchronous serial format, but I've never
|> seen any technical information on it. Does anyone have this available? I'm interested
|> in the general format of the data and handshaking (especially between the drive and
|> the Atari).

Yeah, I found this to be the least described part of the Atari. Look in the old Technical User Notes for the logic levels and timing of the SIO port. Also look there for the modes to setup sound registers 3 and 4 to provide the right clocks. Finally, look over the OS source code (for the old 800, but it's still close enough) for the default SIO interrupt handlers.

Lee Brilliant wrote a two-part series called "Atari Zucchini", where he described how to use a spare 400 as a printer buffer, by programming its serial port to receive data, then send to a printer (on the joystick ports?). It was in ANALOG, I believe.

400. SIO2Amiga update

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-01 16:01:45 UTC
From: eyvind@lise.unit.no
Message-ID: <EYVIND.94Feb1160145@lise22.lise.unit.no>
Source record: 103378

It's been a while, but I've finally managed to get the MAX232 and 74LS368 ICs needed for the SIO2PC connector. As soon as I get around to finishing the connector (probably within the week), I will set up a mailing list for anyone interested in helping to write the server software... I have already received some responses, those people (you know who you are ;) will be included on the mailing list.

To explain what is happening; I'm working on a project to allow an Amiga to be used as a file server for any 8-bit Atari through the SIO port. It is based on a similar project for the PC (SIO2PC/AFS), and uses the same hardware. It should be completely transparent to the Atari, and act as a normal D1:, D2: or whatever. The concept is slightly different from the PC version, since data will be stored as sectors on a virtual disk (ie a single Amiga file containing the sequential sector data) -- therefore, the Amiga needs a handler which can read the Atari filesystem. Also required is, of course, the actual server software, which will handle communication with the Atari.

If you think you can help, or if you're just interested in the project, mail me (eyvind@lise.unit.no); you will be put on the mailing list as soon as I get it set up.

How is that different from the regular SIO2PC? It also stores data in virtual sectors in a disk-file. (I'm not familiar with any /AFS extension, though I would like to be.) In taking this approach, I would REALLY appreciate it if you would use the same format as used on the PC version. (Isn't there some other disk-image format? Maybe you could use that, instead. My point is that you shouldn't make up a new format without good cause.)

402. Who's Who in the Atari Community (e-mail list)

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-01 17:44:38 UTC
From: xx004@cleveland.Freenet.Edu
Message-ID: <2im4e6$rn7@usenet.INS.CWRU.Edu>
Source record: 103380
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,comp.sys.atari.advocacy

Who's Who in the Atari Community

The Cleveland Free-Net Atari SIG is compiling a list of people that are members of the Atari Community that do things that help Atari users and the Atari Community in some way on a continous basis. They are Atari BBS sysops, dealers, developers, publishers, user group presidents, writers, FAQ maintainers, etc. They are even Atari employees.

Unless you send us your name, e-mail address(es), and information on what you do in the Atari Community, you will not be included on this list.

We will not say that "John Smith" should be on the list and then find his e-mail address and then put him on the list. ONLY people that have given us permission by sending us this information will be on the list.
If they do not, we will assume that they do not want to be on the list because of privacy reasons.

If you contribute some way to help others in the Atari Community on a continuous basis and would like to be made more available through e-mail incase someone wishes to contact you, please send e-mail to the Cleveland Free-Net Atari SIG at: xx004@cleveland.Freenet.edu

Everyone included on this list will be arranged in alphabetical order.

Again, the only thing you need to do to be on this list is to contribute in some way on a continuous basis to the Atari Community.

This is a serious list which should help everyone in the Atari Community communicate better with one another.

Please remember to send us your name, e-mail address, and what you do in the Atari Community. Any additional information that you include is for the benefit of the users of this list.

Thank you.

Len Stys, SIG Manager
Cleveland Free-Net Atari SIG

here is a list of stuff that I have for trade/sale. I would like to trade
this stuff for rare or at least somewhat hard to find atari 2600 games.
just send me a list of what you would be willing to trade and what you're
interested in and we'll go from there. if you don't have atari games just
make an offer (I will sell pretty much anything in this list.) you pay
shipping if you are buying something.

John Earney
jearney@farad.elee.calpoly.edu

here's the list:

```
=======================================
=== atari computer stuff ===
=======================================
```

math encounter by Hsu Software (cart, box, instructions,) new
Here is the story:
Dr. Hsu (a professor of computer science here at cap poly) made
this game about 1984 just before the market crashed. he wrote the
game and had one friend do the artwork for the box and another friend
proofread his instructions (the final product looks very professional.)
He sent away an eprom with the game on it and had 5000 cartridges made,
a new phone line in his house and a P.O. box and set up Hsu Software.
he only tried to sell the game localy (about 100,000 "isolated" people
on the central california coast) and it didn't go over well because of
the receint lack of interest in the atari 800. Dr. Hsu said that he
"only sold a few" of the games and after the atari 800 was completely
dead he ended up giving almost 5000 copies of the game to some guy
down the street for free. that's the last he heard of it.
this is the only game that was sold by Hsu Software, but he did make
another pong type game that came in a plastic bag with disk and
instructions.
By the way: I had Dr. Hsu put his signature on the instructions.

super sketch by personal peripherals inc. new in the box
this is a plotter (10"x13"x1") that hooks up to the joystick port.
it has five buttons across the top for manipulating the picture
and a pointer that moves around the rest of the plotter. included
is the cartridge, the owners manual, starter kit (with 5 outlined
pictures for tracing), warenty info etc.

>terminal/window to the wonderful world of comp.sys.atari.8bit??

Well, I USED to use a 1200XL, Kermit 65, and a 2400 bps modem to dial into my
Unix account at school, but now I use a 486sx-25 to connect to the school's
new dial-up SLIP server under Windows, with all sorts of cool net programs.
Oh, and I now have a 14.4kbps modem (max throughput about 57600 bps on the
right data).

Go ahead, call me a traitor, but hey, it works great, why go back?
Besides, within a year or two, OSU probably won't even have provisions for the
old-style terminal access -- they think everyone has PCs, Macs, or Unix
machines and can run this high-power software.

>For downloading or transferring I use the full power of the network to
>the Sun and then offload or upload via Xmodem (or Kermit!!) to my beloved
>Atari!

I FTP files directly from umich or wherever to my hard drive (avg. around
1600K/sec) , then use ATARIO or SpartaRead to transfer to the Atari if
necessary.

>I am running pine as my mailtool, pico as my default editor, and lynx
>as the insanely cool killer World Wide Web VT100/ANSI Internet network
>browser with hyperlinking, ALL FROM MY ATARI!!!!!!!! Plus more +++++!!
>I can even do tildas ``````!!!!!!
(those look like backquotes to me, not tildes, but who knows, this
Windows font might just be weird.)

You wanna see amazingly cool? Take a look at WinMosaic (for MS-Windows) or
X-Mosaic (for X-Windows). You just can't get WWW-style graphics with vt100.
I am curious about how the hyperlinking works under vt100 - I just use the
mouse.

What? Are you saying that 100,000 copies of a game for the Atari 400/800/XL/XE
computer line have been sold (in any country)? It can't be true. I'd be
surprised if there were 100,000 Atari 8-bit computers in Poland, but on the
other hand I have no information at all about this.

Btw, what is 'Operation Blood'? A new game?

>Atari.

How is that different from the regular SIO2PC? It also stores data in virtual sectors in a disk-file. (I'm not familiar with any /AFS extension, though I would like to be.) In taking this approach, I would REALLY appreciate it if you would use the same format as used on the PC version. (Isn't there some other disk-image format? Maybe you could use that, instead. My point is that you shouldn't make up a new format without good cause.)

I had gathered from the documentation that AFS stores the files in the normal MS-DOS way, and calculates which part of a file the Atari wants to read based on a sector map. However, I may be wrong, since I haven't actually tried the software yet (still working on that soldering :)

Now you mention it, of course, I do know that there is at least one disk image format for the Atari; I will use that if I can get the appropriate documentation.

413. Disk Interface

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-02 13:23:53 UTC
From: etlprcr@etlxd30.ericsson.se
Message-ID: <1994Feb2.132353.5554@ericsson.se>
Source record: 103393

If anyone is interested, I have just received the latest copy of New Atari User (the UK 'official' mag) in which there is an article to say that Micro Discount, a UK dealer, is nearly ready to market an interface to allow 720k standard PC or ST disk drives to be used with the 8-bits. The price is rumoured to be less than 50 Pounds (~75 dollars (a rough guess..I don't know what the exchange rate is)). They are also working on an 8-bit sound interface, something like a Sound Blaster....

Message-ID: <2iotf7$8v7@usenet.INS.CWRU.Edu>
Source record: 103394
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.atari

Access to the Cleveland Free-Net Atari SIG has just recently become
more easier by allowing 60 more Internet connections.

The telnet address to this Internet machine is:

telnet 129.22.8.32
telnet kanga.ins.cwru.edu

The new version of the Cleveland Free-Net Atari SIG is not expected to be
released for a few weeks yet. The one that you will see when logging on
to Free-Net is the older version.

That is exactly the mod I want for my 1200XL, without a way to use a
clone supply, I doubt the 1200XL would last long with a 1 meg upgrade
without burning out a 9v AC brick.
It needs a way to directly hook up to 5v DC.

> Btw, what is 'Operation Blood'? A new game?

Perhaps my 'information source' made a mistake, but I think the
100,000 pieces are possible - my source told me that last year 100,000
XL-computers went down to Tunesia (I'm not quit sure if this is
spelled correctly).

Operation Blood was one of the first games coming from Poland. I think
there are now about 40-50 different ones, mostly very good games. It's
because the Polish programmers earn more money by programming the XL
than working in a factory! The disadvantage of those games is, that
the programmers don't need to use English texts, because they sell the
most games in Poland :-(

Operation Blood has good grafix and it can be controlled by Joystick or
mouse (the latest version uses even a lightgun). The aim of the game
is simply shooting everything that moves (i.e. killing soldiers, tanks
and helicopters) - Operation *Blood*!

Bye,
Jochen

Did you ever heard of the HDI (High Density Interface)? It came
without power supply for 250DM (it could be cheaper, if there were
more people buying it), but it can handle up to 4 1.44MB PC-drives!
BTW, the developer doesn't produce it any more, but anyone can have
the schematics to build it by himself (and even sell it!).

Bye,
Jochen

I am guessing you FTP'd it from archive.umich.edu? That's where I got it from and I had the SAME PROBLEM, you might want to try wuarchive.wustl.edu, I haven't had much luck getting on there because of their database problems, supposedly they got hit with a bug (virus, or something) and they are restoring from backups, which doesn't sound very hopeful.

I don't know about SIO2PC30.ZIP, but I just uploaded SIO2PC31.ZIP It's in the /atari/8bit/sio2pc directory on a.a.u.e. It has a few bug fixes as well as an ability to install a DOS file as a disc image, without having to run MAKADISK.EXE This comes in handy if you have a bunch of .DCM (discomm) files that you want to make into .ATR images. I downloaded ALL the Demos in the 8bit directory. I found some dont work on m,y system, even if I copy them to a real disc. Must be because I'm using an NTSC system and not PAL.
Eric

432. actutor{1,2}.arc

Newsgroup: comp.sys.atari.8bit

From: wagner@cybernet.cse.fau.edu
Message-ID: <5TZ0gc1w165w@cybernet.cse.fau.edu>
Source record: 103263

I recently FTPd the above archives from atari.umich.edu, and they appear
to be corrupt, here are the files I need from the above archives:

actutor1.arc:
atutor.012
actutor2.arc:
aprog.401
aprog12.002

Anyone who has these three files could you ARC them and send them to me?
I managed to reassemble most of the archive, seems that there is an
archiver that loses a few crucial bytes here and there.

Unless FTP is actually to blame, this would be interesting.

435. 8-bit unzipper

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-05 17:33:16 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <2j0l8s$o21@usenet.INS.CWRU.Edu>
Source record: 103269

Ahh.. I been messin' with unzip for
our 8-bits. First a little basic
info. Unzip uses 5 methods of
uncompression.
1. Simple extract
2. Unimplode (earlier zip)
3. Unreduce (early zip)
4. Unshrink (early version)
5. Inflate (zip 2.04g, the latest)
I have source code in Pascal from
Samuel H. Smith for 1 to 4. I have a
huge bunch of 'C' sources by 50
people called the Info-zip group,
including source for the deflate
algorithm. Now I have done
unimploding in Pascal on 8-bit. It
was SLOOOOWest. I switched to
ACTION!, still awful slow, but 3.5
times faster than CLSN Pascal. We're
talking 100 times faster on my XT
clone than I can do with my ACTION!
prg. My code is not particularly
efficient, usually, but this time I
am following the source from Smith
almost verbatim. The only thing
left is assembler, which I'm not
about to try. Bottom line:
IF this project is ever to come to
completion, it will take a multiple
person effort. Say, I do the
Unimplode, overall shell with
extract. Somebody take one of the
other methods and use my shell and
put in one of the methods. I
envision a group of programs that
chain to do the unzipping. A simple
zipper ought to be plausible along
with the unzipper programs. Doing
the whole thing in 'C' is another
possiblity, but I really think a
chain from the shell to each of the
four methods is required.
Is it really worth it to make an

You should probably check the RPM of the drive that doesn't
run those programs.
An 810 drive should be at 288 RPM.
An XF551 should be at 300 RPM.
Right off hand, I don't know the correct RPM for the 1050.

Anyone?

I believe the XF551 is the only exception to the rule that drives designed
for the 8-bit are supposed to run at 288 RPM.

If I'm not mistaken the current HDI is a PBI device with no chain out which keeps one from using a hard drive interface. the older one DID have a chain out I think. Plus I believe it used a custom OS which would also keep it from working with the Multiplexer since that also uses a custom OS.

P >version of Lemmings I would buy it. Please mail me with a mail order place
P >that will sell me recent programs for the 8-bit!
P >Eric

There is an 8-bit version of Lemmings in the works. I think it is being written in Europe. I also cite MEGABLAST as one of the most recent games that really blew me away--mostly in the fact that it uses digitized game effects and music while simultaneously doing graphical animation rather than blanking the screen!
Around these shores game programming has been much slower. Jeff Potter has pretty much finished his MIDIMAZE clone for use with the Gamelink interface but since it is only a 16K game it is not a visual masterpiece. There have been suggestions for the next Gamelink game to do a 3-D space-war type of game, and I would really enjoy such a game.
Now, is Lemming possible? I think so, and I cite something like Lode Runner as an example of how this would be implemented. I don't know if they are PMGs or playfield animation, but I think it was an Apple II port thus no PMGs, and the animation on the little guys is very smooth. One could use the same method for many lemmings.

BK>Sounds quite interesting! Would it have it's own RAM and be able to act as
BK>a device or something (like A:udio or N:oise or something) on the handler
BK>table, or will it be controlled some other way? Will it support digitized
BK>sound (well, seeing as the 8bit does already, this is a dumb question.. I
BK>guess "what are the spex!?" seems more appropriate)

I have my doubts as to the need for an 8-bit soundblaster. If it leads
to some nice side projects fine, but for sheer sound generation, Pokey is more
than adequate. Current digitizers for the 8-bit are sorely lacking in the
sample rate category. I don't know if it is because of sampling through the
joystick ports or what. I am still curious to know if perhaps the A/D happened
through the cart port it would yield a better sound. I am just a little
pessimistic that any hardware add-on innovated today as fundemental as SOUND
will not be utilized enough due to the fact that so few programmers are coming
out with anything NEW--since programmers of games and stuff would have to make
direct calls to the proprietary hardware of a sound OR VIDEO upgrade board.
Considering the fact that most of the remaining programmers are in relative
poverty, I doubt that many of them would have the hardware anyway.
When it comes to video and not audio the picture is a LITTLE different.
I don't think there would be many games for a new board, but there WOULD be
activity revising terminals for better color ANSI and such. Like if we finally
got a high speed compatible CGA style board off the PBI or something--I know
Bobterm and such would get an update. Most of the gaming constituent does not
have elaborate hardware. Many game-only 8-bitters have a very minimal system.
When it comes down to what types of programs would be written for new hardware,
it is almost always UTILITIES only. Which is why, like I said, programming
for a soundblaster for the 8-bit would not happen much outside of perhaps
applications such as digitizing (for playback with pokey) or MIDI or something.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit,rec.games.video.atari

The Cleveland Free-Net has increased its Internet connections once again
in the past week:

<<< FROM THE ADMINISTRATOR >>>

INTERNET ACCESS UPDATE: freenet-in-a.cwru.edu and freenet-in-b.cwru.edu
are now nicknames for kanga.ins.cwru.edu (129.22.8.32). kanga is a
486/DX50 with 64 Mb of memory running BSD/386. It supports 80
simultaneous users, for the time being. freenet-in-c.cwru.edu still
points to nextsun, which has an increased user limit of 25. With these
changes, the capacity for users accessing the Cleveland Free-Net via the
Internet has increased over the past week from 15 to 105 simultaneous
users (a net increase of 90 users).
[chet/mak - Mon Feb 7 15:07:53 EST 1994]

Even though the new version of the Atari SIG will not be completed until
later this month, we still look forward to seeing you at the Atari SIG that
is presently online!

Thanks.

I was not aware that you could use the "G:" device with any language besides ATARI BASIC ? I tried to print to the "G:" device from ATARI BASIC, but to no avail. The only time I was able to get the "G:" device to function correctly was as a replacement for the "P:" device in a LIST command, e.g. LIST "G:" Is there a more generic way of using the "G:" device? Has someone written an update to it? The only method I could substitute the EPSON/STAR G: graphics for the P: device was via a BASIC "LIST" call (on a stock ATARI 800XL via an ATARI 850 printer interface). Other examples (TEXTPRO ???) of how to use the "G:" device for printing ATARI ATASCII "command graphics" and inverse / reverse text would be most welcome. Thank you.

]bare-minimum standards???

IMHO, it wouldn't hurt to move on beyond the XEP80, which never got out into the Atari community in big numbers, anyway. Any new device that FTE designs could take advantage of better technology than the old mono-chrome-TV-without-a-tuner monitors most of us have tried to use for 80 columns on our 8-bits. The Atari SM124 monitor from the ST world is commonly available on the net used for around $75, is a crisp black-on-white display, and even includes a speaker. Compatible devices are still being produced for those who wish to spend more. To make the 8-bit viable on into the late '90s requires a decent, inexpensive 80-column display and the software to use it, so any new device such as I have described must work with what little 80-column software exists, particularly AtariWriter 80 and an 80-column term program. I'm a real cheapskate, but I'd be willing to spring for $75 to be able to hook one of my old SM124s to my 8-bit.

Is this achievable within the limited means of FTE?

(Mr. Fixit asks if an 8-bit unzipper would necessarily require
extra memory.)
As far as I know it would. The only source I have for it is
in 'C' and I haven't even looked at it seriously. Another
fellow, Craig Lisowski, says he has looked at the deflater
and it requires 32k 'windows'. I presume this is a buffer of
some type.

454. Survey

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-08 17:45:39 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9402081702.AA17283@phinet.smithkline.com>
Source record: 103284

Well thanks to Marek Tomczyk I'm at last getting a trickle of CSA8 newsfeeds, having not seen a Digest since like November.

I saw Tom Drake's survey & couldn't resist.

I had a 256K 800XL on my desk at work for 5 yeears (1986-1991). I found the newsgroup I think in 1989 or so. At the time my desk system included a U/S-Doubled 1050, a P:R:C, an XEP80 (modified to draw its power thru the joystick port), & a 2400 Bd modem. In 1990 I bypassed the modem when they upgraded my company's VAX terminal servers to the DS-200 series, so I got a full hardwired RS232 port directly connected to the VAX mainframe. It was nice. I used John Dunning's KERMIT-65 v 3.7 running under SparatDOS for all my coms & file uploads/downloads. Make that SpartaDOS <sheesh>.

Then in 1991 mt Boss told me to "take that damned Atari videogame thing" home. (As everyone knows, anything with "Atari" on it MUST be a videogame, right? Never mind that I had used the "videogame" to write 4 manuscripts for scientific journals plus numerous internal memos & e-mail coms related to my job.) Having taken an $800 tax deduction for the system in 1986, by 1991 i was depreciated anyway, so effectively The Guvermint paid for that system & it was a freebie.

My company rammed a Mac SE down my throat (which I hated), then in 1992 gavbe me a Mac-IIci which is only slightly more tolerable. Since 99% of my Internet access is done from work, I'm mostly using the Mac running under VersaTerm-Pro & System-7. (This Mac has a 240meg Quantum hard drive, so you just HAVE to have System-7 so you can join the Memory Hog Club.) So, I'm using $5,000 worth of hardware, at company expense, to do pretty much all the same jobs for my employer that I did with the Atari at no no cost to my employer whatever. Somewhare in the annals of Corporate Mentality I suppose that makes sense. If anyone sees the logic, please let me know? (I'm a simple-minded scientist, big-business Corporate Stuff seems a little beyond me.)

Not that I have an Attitude or anything. (Who, ME? Naw, uh-uh, never, not Me!)

Kinda scandalous, huh? I mean, here I am the Head Honcho of Atari Classics magazine & I access the Net with a Mac. Weird world, hey?

Once in awhile I access the Net from home, using the same system I use to run AC. I go through the Modem Pool here at work from my 2400 Bd modem at home & access the Net thru the VAX mainframe just as I do from my desk at work. The system at home is a 1-meg 800XL running under SpartaDOS from a SyQuest 44-meg removable hard drive with a Black Box/Floppy board as the RS232 interface, still with KERMIT-65 as the terminal software.

There is one advantage of VersaTerm-Pro on the Mac over KERMIT on the Atari: with the Mac you can access screens you've just read by using page up/down

which is real handy for answering long emails. With the Atari the text is gone once it scrolls off the screen.

UP>I agree with you that most of these 8-bit games were quite good. However,
UP>we don't want to mark time, do we :) ? We just need SOME progress at
UP>least. Otherwise we would still play "Ping Pong" :(((.

MegaBlast showed what is possible when using some of the newer XE features. Unfortunately most commercial software never expanded itself to fully utililize XE banks. Some stuck with a maximum of only 16K to remain cartridgable. Some DID go into banked ROM. Some were "XL/XE only" and used up the extra ram under the OS, but still very few considering the several year time period between the introduction of the XL and the death of 3rd party game support. It was downward compatibility to blame for that. I've wondered for a while that if Star Raiders is only 8K then what might be possible with 32K or more... But it never happened. Star Raiders II sucked. Just think how expansive a graphics RPG could be if it were written for hard drive usage? The best we have gotten are a few online RPGs on 8-bit boards (text based) which can be much more expansive than Zork or Alternate Reality ever were.

There is indeed room for improvement--the capabilities of the XL/XE have not yet hit the wall as far as games are conerned.

JD>The 65802 is a very cool chip, although as mentioned, would only be plug-in
JD>compatable in the early 800's. Even then, I don't know anyone who's tried
JD>it, but it probably would work.

That is the kicker. There are probably a single digit number of die hards
who use an 800 as their primary machine--since it is very difficult to hard-
drive it and many programs use the extra 16K or XE-style banking in XL/XEs.
Unfortunately there is no affordable and quick upgrade. You and I both know
how hard it is to try to overcome the 1.79mhz barrier to really give a 65816
system increased throughput <g>. To make something like this worthwhile, it
is difficult to avoid MAJOR hacking. It _may_ be useful if a generic tri-state
buffer board ala the T816 were developed to allow usage of the 65C02 or -802.
I have never seen the T816 so I don't know just how involved it is to get
a standard 6502 pinout to work with an XL/XE. If you remove the 24 bit address
electronics of the T816 board, then perhaps it would be simple enough to write u
as a text file and make with a simple perfboard and some logic chips. If it
is simple then maybe it will pick up with at least as much popularity as banked-
ram upgrades. Than maybe some applications will be written with your assembler.
I don't know what the 802 might facilitate, maybe Zip-unzip or Zmodem.

457. User Group Meeting Notice

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-08 19:26:49 UTC
From: dimasi@ssd.comm.mot.com
Message-ID: <1994Feb8.192649.18711@lmpsbbs.comm.mot.com>
Source record: 103288
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

The Suburban Chicago ATarians (SCAT) user group will hold its February meeting on Tues. Feb. 15 at 7:30 PM (7PM setup), at the College of DuPage, Room SRC1046 (at the North end of the SRC cafeteria; the SRC building is located on the SE corner of Lambert Rd. and 22nd St., in Glen Ellyn). Both ST/TT and 8-bit software will be demonstrated. Everyone is welcome to attend.

[If this article shows up outside the greater Chicago area, I apologize - the "chi" distribution may not work.]

Nick DiMasi, SCAT President

: with the Mac you can access screens you've just read by using page up/down
: which is real handy for answering long emails. With the
: Atari the text is gone once it scrolls off the screen.

This wouldn't be too hard to add... a short while ago we had some requests for modifications to Kerm-37... as I recall, one or two people said they were going to work on it themselves... did you (whoever) get the source code for the program??? Think a scrollback could be done quick and dirty in the next release of kermit? Even a "swap-screen", to view simply the last 24 lines or so would be great. Should be feasable using assembly routines up to about 19.2k baud without appreciable loss, since it would just be a "memory buffer", not having to put it to the screen until requested (via "hot-key" combination or whatever)... hmm, heck, this is something I'D have no problem writing up as long as I can trace how they handle their screen i/o in 40 col, 80 col, and 40-col-split-screen modes, as well as... hmmm... still could be a couple hours work, EASILY... yiie. I need to get some refreshed in my Assembly for the 8-bit...

Any thoughts?

I am looking at the C Source code for Zip, produced by the group
known as Info-Zip. In their Source code, each module is EXTENSIVELY
commented at the beginning as to HOW each particular method is
done, both in theory and in actual code. I believe they also have
all this information in 1 general INFO file, that accompanies
their standard distributions.
The C source code should be ANSI standard. Turbo C is a SuperSet of
ANSI C, but they tend to add too much of their own NonStandardness to
the language for me to take them seriously -- the same deal goes for
their Turbo Pascal. Now as for Atari_C, if it was already written for
it, then we'de have had an Unzipper and this whole discussion would me
silly. (grin)

|> in doing this, but technically could this be done?
|> Eric
|>

From my experiences with SIO2PC, I don't think this will work for the simple reason the timeouts would occur when reading/writing.
This is based on my experiences with using SIO2PC to access disk images on the Hard Drive instead of the ramdisk. When I had the images on my double space partition the atari timed-out frequently. Same image on the uncompressed partition did not cause any problems at all. This behaviour was consistent with several different images.

Also, if memory serves, the SIO2PC uses one(several?) of the rs232 control lines (I can't remember which) in a strange way that could not be transmitted over a modem.

If anyone can confirm/refute this please do.

BTW, I whole heartily recommend the SIO2PC. I have found it to be a superior system.

If anyone is interested I think I even still have a PCB etching template for the SIO2PC hardware.

(Somebody asks about G: device)
G: device, Analog 35, pg. 81, Oct. '85. by Charles F. Johnson.
(I have an extra copy of the magazine which I would like to
trade for any issue before #18 or #59.)
List "G:" for basic.
list #g: for assembler
G1: prints on one line.
G2: Exactly prints like on screen
G3: Same as G2:, with dbl width chars.
G4: 60 char line, dbl width.
Print grahics 0 screen. xio 16,#1,0,0,"G:"
Printing pictures:
xio 64,#1,0,0,"G:"
(Inverse printing) xio 64,#1,0,255,"G:"
It's a fantastic program.
It's for Star printers, but I think it will work on Epson
compatible printers.

Your probably correct. If the pins are the same just organized differently
you could come up with some scheme to rewire them, but my question is
WHY? What is so great about this new chip that would make you want to
modify your old one? Am I missing something about this CPU that I
shouldn't be? I think we all know that the clock speed is fixed, so does
it have enhanced processing in some other areas? Thanks.

467. I have tons of 8bit equipment for sale!!!

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-09 16:21:10 UTC
From: Anthony Brown <anbrown@husc.harvard.edu>
Message-ID: <1994Feb9.112111.30021@husc14.harvard.edu>
Source record: 103298

I have tons of 8bit stuff that I need to get rid of!! If anyone is interested, let me know.

here is a partial list.

1 48k 800 with all cables, power supply, an apple III b/w monitor(will not separate)
1 256k 800xl with all cables, powersupply, a taxan green screen monitor(ditto)

2 us doubled 1050's with cables, power supply
1 normal 1050 with cables, power supply
1 percom sd data drive with cables, power supply

850 interface, with cables, power supply
1200 baud hayes compatible modem with cables, power supply

1 supra micro print printer interface
1 apeface printer interface

1 koala pad with microillustrator cart
another touch tablet, the animation station w/ software.

diamond gos, with word processor, drawing program, and developers kit.

spartados construction set
atari writer plus
action programming language
mac 65 assembler
assembler editor
Reevesoft desktop publishing software(not for use with diamond gos)

all of the above comes with documentaion except the touch tablets.

lots of cartridges: here are some of them
atariwriter (2)
Donkey Kong
Galaxian
Asteroids
Caverns of mars
Shamus
and lots more, at least 5 or 6, maybe 10. I just can't remember them all.

at least 1 joystick (I can't remember if I have more than one)

lots of other software including backups for about 90% of them

tons of back issues of antic, analog, and a few copies of that atari magazine
loads of books mostly for the atari only, some(3 or 4) are for all home computers, some are for the 6502 assembler.

I am asking for $600.00 american cash for EVERYTHING, or best offer (serious offers only), you pay shipping. I think that this is a good deal, because first of all this is my entire set of atari equipment, since I was in Junior High School. And It is about 3 Large Boxes of equipment, not including the disks, and monitors. These boxes weigh between 75-100 lbs. This is a lot of equipment. If you want some thing in this list, make me an offer. If you live in the San Fransisco Bay area, most of the stuff is there. You could save lots of $$$ in shipping. I am in the boston area with a few of the things(800, 2 drives, 850, some software) and that is what you will have to pay to ship.

Okay, who has some timing specs (vertical, horizontal scan frequency, or range, etc.) for these monitors? If these can scan at near 15.75kHz Horz., we might have a chance. Anything much faster requires either a mod to the monitor (ouch!) or an extensive h/w project for the 8-bit.

Most of these magazines don't work together with devices connected to the
parallel port of the 8-bit. Try to disconnect all these devices and boot a
magazine that hasn't worked so far. Hope this works !

With all of this talk about the XEP80 and monitors and such, I was wondering, just how well does a CGA monitor fare with the ST monitor or the Common-door 1702? Could it ever be possible to interface some type of IBM type monitor to an 8-bit. Is it even possible to connect one of the old RGB type monitors to an 8-bit. Unfortunatley I have never owned a monitor (as if that isn't obvious), and would like to know more.

Thanx...

I have the following 8bit Atari hardware for trade (I prefer to trade
over selling):

3 x Atari 850 serial/parallel interfaces w/power supplies -- $40.00 ea.
1 x PR:C: serial/parallel interfaces (uses keyboard power) -- $35.00
1 x Stock 64k Atari 800xl w/power supply -- $35.00
1 x 320k (with Freezer & AC Audio/Video upgrades & socketed) w/pwr -- $65.00
1 x Hayes 1200 Smartmodem w/power supply - $30.00
1 x ADC 1200 Smartmodem w/power cable -- $20.00
1 x Atari 1050 disk drive (stock) w/power supply -- $30.00
1 x Indus GT double density disk drive w/power supply -- $50.00
1 x Percomm data disk drive (with printer port) -- $50.00
2 x Atari 1027 printers w/power suppies -- $25.00 ea.
1 x Atari 1020 printer/plotter (no power supply) -- $15.00
1 x 3 slave, 1 master (with about 40 ft of cable) MUX system -- $250.00
1 x 410 tape deck - $5.00
5 x 360k half height IBM style drive mechs -- $10.00 ea.
2 x 1.2m half height IBM style drive mechs -- $30.00 ea.
1 x DUAL 360k full height IBM style drive mech -- $15.00
1 x Atari TrakBall - $8.00
1 x BEST version TrakBall - $10.00

Trades Wanted:

U.S. Doubled chipset w/docs
Happy chipset w/controller board
SIO2PC complete w/software
OS ROM upgrades (US+, etc..)
ComputerEyes complete w/software
Koala Pad w/software
BlackBox
Functional MIO (printer port on mine is hosed)
Functional 2line cordless phone
XF551 high density upgrade kit

Wellllll, the 65802 is a 16 bit internal version, of the 6502, additionally it has additional registers (Direct allows zero page style addressing anywhere in the 64 k address space) and new op codes (block move, branch always, direct register to register moves, coprocessor support etc) and several new address modes (indirect, stack relative etc). Thus you can move zero page and the stack anywhere you want to, allowing you to really think about writing relocateable code.

The 65816 has a 16 meg address space, coprocessor support, program and data bank registers (like Intels segmented architecture). There will be soon a 32 bit version out.

I suppose it depends on whether you like playing with the 6502 assembler code or not, whether it's worth installing. By the way the super Nintendo uses the 65816.

478. AR followup... Phil? Gary? Anyone?

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-10 06:17:03 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CKzw4F.n0J@utnetw.utoledo.edu>
Source record: 103159

This is a copy of a letter I've just sent out to Phil Price... I've been trying to get in touch with Gary Gilbertson to find out what musical masterpieces he's released for the Atari 8-bit (and hopefully get a few of them). I heard he might've been considering a "music sample disk" for a small fee ($5 or $10). Does anyone have his current email (or postal) address?

- -

Did you ever hear from Gary yet? I've been wanting to find out more on his old Atari masterpieces... maybe even get a copy of a couple of them... do you have a mailing address I can reach him at? I've heard nothing, and it's been about a month and a half now.

How about the AR idea? I know you said you were busy, but have you thought about releasing the idea to another software company for IBM or other system release yet? Apogee for instance? Any work in progress towards the other modules (Wilderness, Arena, Palace, Final Confrontation) - maybe even a thought-out plan for what needs to be done? I've sure others would consider taking up the challenge to complete the AR epic adventure! Heck, with some actual NEW software just being released for the Atari 8bit, and if you do ftp the game engine, etc. to umich or some other Atari site, who knows - some us out there dwelling in Atari-land might take it upon ourselves to write interested followups to the City and/or Dungeon!

-Tim

PS: I'm posting this the the newsgroup also in the hopes that someone else has had contact with Gary Gilberston or has seen any of your Alternate Reality source on one of the sites/BBS's... so far, no one has. :(

Does Synapse still exist? uh oh... hold on while I delete a few files.

I haven't, but I would like to know what other Syn-Apps you have out there
and possibly where to find them.

480. ACTION INFO

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-10 08:20:01 UTC
From: Tim.Gearin@f47.n282.z1.fidonet.org
Message-ID: <760977644.AA00863@rochgte.fidonet.org>
Source record: 103161

Im looking for documentation on 'Action!' language-specific locations.
So far I've figurured out where a few of these locations/pointers are by
examining some 'tool-kit' programs and the user manual. From looking at
the toolkit programs, it seems to me that the people who wrote them had some
inside info on the language. I only wish for the same thing so I dont have
to
end up taking the whole f*****' language apart just to hunt for something
which
is already documented(supposedly anyways).

heres a few locations i've written down:

14 - compiled code pointer (in manual)
$495 - number of pages for symbol table (default=8)
$4A2 - current character(not sure about this one)
$4CF - Line max (not tested)

There also seems to be a routine in this area ($480-$580) called by
Action
from the monitor bank. right now im mostly interested in finding where the
actual symbol table pointer is and it might be handled by this routine since
there are no references made to the symbol table length($495) in
the monitor bank. Im dont know the specific location the jump went to;
should
have wrote it down I guess.

Also the cartidge boot subroutine can be called by a JSR to
$A326($A323 for older versions). There are some registers up in the $D500
area
that directly control the cartidge that I know how to use too.
speaking of that, I have many questions regarding this area as well. It
seems
to be very top-secret and i'd like to know the lay-out of this area and which
cartidge pins are affected ;and how. So far I found out how to both enable
and
disable the 'Action!' cart from here. Only problem, It locks the computer
and
the RESET key coldstarts the machine. it still comes in VERY handy though.

well thats all, Thanks.

: You're right, but you could probably put in a dip socket and rewire it for the
: correct pinouts?

: kenth

Well, I have an 800 kicking around with the funky XL/XE style 6502 in it.
Late model 800s evidently used 'em too. The processor card has a chip or
two fewer on it so I think you would need a little daughterboard with a
bit of "glue" but one could practically design one of these by comparing
the processor card in my 800 with the old 6502 processor cards.

And by the way, Lance, yes, the 16-bit versions are supposed to be really
nice. I think John Harris has already gone over all the added features.
Sheesh, if we can make this a simple and cheap enough upgrade (as in if
somebody will make and sell a little upgrade kit) we might see it in a
significant portion of the remaining atari community's machines. That
would be cool, but I'm not holding my breath. Christ, how many people have
done the stereo mod?

Has anyone actually purchased these magazines???? I am curious since the price seems to drop with each posting of this message. Why would these mags be considered so "valuable" anyway? Is there some secret Atari guru hiding in the Great White North that we don't know about contributing to these issues?

I am serious here... I am not trying to insult anyone just trying to determine what the heck is so great about these mag.s.

Is anyone out there even buying????

> games than what AtariCorp. produced.

If anyone of you is intersted in buying Polish games, I could ask a
small distributor (Powersoft), if he would send games to the US. If
somebody would collect the orders it would be cheaper. The price for
each game would be about $5-$10 plus shipping, perhaps it would be
even cheaper (Powersoft gets the games for a *very* low price).

The Polish texts would be the main problem - but who needs advice to
press START, or moving a cross over the screen and pressing fire? :-)
Marek Tomczyk is the inofficial translator for the game guides - if
there are enough English speaking people buying these games, he would
probably translate them into English, too ;-)

Bye,
Jochen

I would STILL like to see the schematics for this! I DON'T have a HD and don't plan to be implementing any multiplexer in the near future (no need to as a single user)

So, this would definately fall into the category of VERY USEFUL for this poor 8 bitter. I can't afford to buy a Black Box AND a Floppy board when all I need is a floppy board type add on. It is my understanding that you must have a black box to use the floppy board. If I am wrong PLEASE tell me since I would LOVE to have a floppy board alone.....

Nonononononononono! The HDI is connected to the serial port, as if it
would be a normal drive. It doesn't need a custom OS, but it supports
Ultra Speed (or call it Turbo mode if you like this better) with up to
76000 Baud. BTW, the HDI I was talking about has only one version -
neither a new nor an old one!

> more information on it?

I think it is freeware - you can copy it, but you must not request a
(high) copy fee.

It's a quite nice C-package, but it is veeeeeeery slow (especially the
linker). The programs, however, seem to be faster than Turbo-Basic
progs. If you really want to use it, you should have a Ramdisk!

I think it should be possible to compile the compiler on a PC to get a
crosscompiler!

> 2) The only disk drive I have is an unchanged 1050. How can I get the info
> from a PC Clone over to my XL?

The easiest method should be a RS232-link between the XL and the PC.
There are various simple solutions (Datari, SIO2PC), and more
professional methods (the RS232 of the Black Box, Atari 850,...).

I hope this helps a bit!

>tell me since I would LOVE to have a floppy board alone.....

Some months ago I got the idea of making a sort of FDC-Cartridge. Shouldn't be that difficult. I thought of putting a WD1771 (same one as inside the ST) and a latch on a print and locate them at $D500-$D505 (4 location for the FDC, 1 for input and 1 for output signals.) The $D5xx activation signal is already available on the cartridge port so the adress decoder can be fairly small. On the other side of the cartridge you could place a shugart bus or a 14-pin ST-Drive bus...

Until now, I came across only two problems.... time and money... (and maybe the fear that it won't work... I'm not an expert on hardware...)

Could somebody give some comments on the whole idea? Is it just some of my illusions or can it be worked out?

]Okay, who has some timing specs (vertical, horizontal scan frequency, or
]range, etc.) for these monitors? If these can scan at near 15.75kHz Horz.,
]we might have a chance. Anything much faster requires either a mod to the
]monitor (ouch!) or an extensive h/w project for the 8-bit.

My (probably faulty) recollection is that it scans much faster than that, but then I was assuming that whatever was interposed between the monitor and the XL/XE (ala XEP-80) would handle the conversion. Since I'm a mechanical engineer, I have no way of knowing how difficult the electronics would be to do this. I'm sure it would be a challenge, but I'm also sure it would have a market among the 8-bit Atari crowd (including me). I oughta ask some of the EEs at work just how ridiculous my request is, but then I'm old and senile and will probably forget by the time I get there.

Source record: 103173

Might as well add my US$0.02 worth (that's $0.027 in Canadian funds :-)
At home, I've got the following configurations:

- stock 130XE

- 800 with 288k memory and RAMROD OS with both the 8k Omnimon and Omniview chips (from Newell) and a Percom RFD-44S1 DS/DD floppy drive

- 800XL with 256k mounted inside a PC case with a number of other goodies:
- TransKey adapter and a 101-key PC keyboard
- Black Box/Floppy Board combination
- 5.25" 1.2M and 5.25" 360k bloppy drives
- 40MB 3.5" Quantum SCSI hard drive
- Zoom 2400 baud modem, shared with a 386-clone
- Star SG10 9-pin dot matrix printer, also shared with the PC clone

Although I could use this setup to call work and access this newsgroup, I don't because it's long distance from home. Instead, I use our SparcServer 690MP to read this group and ftp files over. If I've got something I want to take home, I simply copy the file to an MS-DOS compatible 3.5" floppy drive using one of our SparcStation 2's, take it home and copy it to a 5.25" floppy on the PC, and then use the BBXFER software supplied with my Floppy Board to read the 5.25" PC floppy with my XL.

Voices from the past..... Sorry to report that I don't use Syn-Calc any more. Now I use Excel on a PC here in the office (and at home). But I sure used it lot in the early 80's on our 800 at home. Mostly it was used for keeping grade records for the large introductory courses I was teaching at the time. And it worked great, given the hardware printing limitations. In order to get enough working space for a large class, I had to add the Axlon 32K upgrade to the 800. I don't recall ever having any problems with the combination. It served me very well.

Michael recently uninstalled the Axlon from the 800 for reasons that I forget. I think it was incompatible with something else he wanted to run when he was home. I expect he will post a follow-up and remind me what it was. The information might be useful to someone else here as well!

Michael Silva, tell us a bit about what you are doing now. There is always interest in what has happened to 8-bit programmers from the old days.

A Synapse programmer! Here? Neat.

Can't say I use SynCalc, but I get plenty of enjoyment from
the Synapse games I have.

I guess I'd like to know where the programmers ended up. Any
information on Bill Williams, Mike Potter, Steve Hales (went
to Access I believe), Bob Polin, Russ Segal, or William Mataga?

Thanks for making yourself known.

Classic Atari Collection Sale
Brian Totty
totty@cs.uiuc.edu

Here is what remains of my Classic Atari collection. I'm graduating this term, and can't afford to keep these classics around anymore. Please help me find good homes for this stuff!

There are many excellent items down there, and some are now quite rare. Many come with docs and original boxes. Even better, many are priced at just a buck or two!

If you are interested in this stuff, send email to totty@cs.uiuc.edu. Buyer pays shipping, and I have made the minimum order $15, to prevent me from making too many trips to the post office. I handle orders in the order I receive them, so please be prepared to buy partial orders if some of the items are sold (otherwise there is lots of cyclic negotiation, conditional purchases, and everything gets way too complicated).

|> With all of this talk about the XEP80 and monitors and such, I was
|> wondering, just how well does a CGA monitor fare with the ST monitor
|> or the Common-door 1702? Could it ever be possible to interface some
|> type of IBM type monitor to an 8-bit. Is it even possible to connect
|> one of the old RGB type monitors to an 8-bit.

Bob Woolley has covered how to connect your 8-bit Atari to either an MDA or CGA monitor in the December '93 Atari Classics. He also tells how to connect an XEP80 to a TTL monitor (MDA or CGA).

Connecting your 8-bit to other PC monitors (like VGA) ends up being a difficult task for two reasons: the Atari runs at a 15.75kHz horizontal frequency, and it doesn't output RGB. VGA monitors want something above 31kHz horizontal, and must have RGB.

Speeding your Atari's output above 31kHz horizontal is a formidable task. You'd either have to replace your Antic/GTIA combination with a custom chip set (ugh), or capture the GTIA's output into a line buffer and spit it out twice as fast (simpler, but still difficult).

Converting the Atari's composite signal (even split luma/chroma) to RGB is difficult without resorting to some custom chips. You've got to demodulate the color components much like your home television or composite monitor does. Chips exist to do this, but since you're doing what already goes on inside a composite monitor, don't expect any increase in quality (i.e. color artifacts in graphics 8, color fringing on boundaries between two contrasting colors, etc.). Ideally you'd want to replace your Antic/GTIA again to have them fetch and interpret colors as defined in RGB, and output them as such. And even then, with this mythical substitute chip set, you'll quite likely lose compatibility with a portion of your program library, which may depend on quirks in Antic/GTIA operation (like APAC mode :^).

I finally decided to just write a couple "wish list" programs I've been hoping to find somewhere in the vast Atari archives... after checking around, it seems I have more 8-bit software LEAPS AND BOUNDS over anyone I've ever encountered. Most of it's legit Public Domain stuff too!!! (never though I had that much, but I do have the archives of several major US Atari clubs)

What I'm hoping to write is a simple TSR-type DOS mod. Upon pressing a couple keys, it'll kick into a short routine which will allow you to assign new drive id's... for instance: D1: will now actually be D5:, D4: could be D2:... any combination! The interrupt, inputs, etc. are all easy stuff. What I'm stumbling on is EXACTLY where in memory (standard DOS (Atari and MY-)) the routine lies which handles the signal requests to and from the drives... you know... opening D2:WHYME.TXT, the drive ID has to be coded in the I/O request, right? I've seen simple mods like this done in the mid-80's on unmodified systems... the programs already exist, but no one has them!?! Also looking for the area in memory signalling a "warm boot".

Someone has to remember SOME of this, right??? I've attempted to look into MY-DOS code, but it's in good 'ole Mac65 bin-mode... don't think the old Atari Assembler editor will handle it... How about the new MAE.ARC from... argh! I even received a copy from him... ummm, Harris... I think... man, I feel bad now. I never had time to go through the new assembler to see how it works yet!

-Tim

As to the parts where the device id is coded into, that would be
dealing with the SIO command packets. (As you may be able to tell,
I primarily deal with Unix technologies and terms now...)

Of course, as soon as I get enough free time on my hands, I'll dig
out my boxes of floppy disks with M/65 source code to many of my pet
projects. (sigh, too many to count now)

Might they be HAPPY versions? If so, then you need an 810 with the HAPPY
mod. I have MANY disks full of :(happy): stuff that I can't use,
either. I'm just waiting for a friend to get off his duff and give me HIS
810, which is sitting in a closet at his house. Along with the 3 or 4
800's, a 1050, an sx-212, a 130xe, about 750 floppies full of older 8bit
pirated stuff (games and utils, mostly)...
He wants to give me his desk, too, which I could DEFINITELY use! (Just
ask Glenn Saunders about that, he's seen my setup here.)

I know two possibiltities, but I think you won't like both:

- Turbo-DOS: it's simply a DOS, which is able to exchange the drive
numbers, but it doesn't support harddiscs or something like that.

- SPOS: a replacement for the old OS, which has a high-speed SIO,
Freezer, etc. (and of course replacing drive numbers)

Both are NOT PD, they cost each about 50DM

Bye,
Jochen

There's a little trick I used some years ago for a 14KB RamDisk (you know,
RAM under ROM) for the 800 XL. It's quite simple. Just change all jumps
that DOS makes to $E453 into a jump to your own routine. This routine
replaces the drive number (which is located at $0301 as a byte) with the
wanted drive number. It's only a matter of a 9 byte table.

```
; E453 trap...

LDX $0301
LDA CONFIG,X
STA $0301

JMP $E453

CONFIG DFB 1,2,3,4,5,6,7,8,9
```

If I remember right, DOS 2.5 makes only one ore two calls to this routine.

Hope this helps,

IvO+> van Poorten

Umm, built in? To SDX? Really... well, might be another great reason to
add to my "why I need Spartados-X" list. My main anchor to the MY-DOS world
has been my Astra drive (now running 3 360k drives)... but if I can get my
hands on a couple DD single sided drives fairly cheaply (old GT's, RANA, or
Trak - preferrable GT or RANA), I may just go all out and get SDX from
someone (or order it if FTE comes out with a new revision!)! What are some
of the common features of SDX that sold you to it?

-Thanks for that info!

Please, enlighten us at to both! I've not heard of either one! I know of
another OS change that will allow it... but would like to know what other OS
modifications are out there!! Turbo-Dos? Who makes it? Any decent ram-disk
support? I don't have a hard drive, and don't plan on one anytime soon, so
Turbo-DOS sounds very tempting! Is the price you mentioned 500 Marks?
Any idea what that translates to in U.S dollars, Canadian, or U.K pounds?
Any news of the floppy controller yet?

-Thanks, this also may solve my problem!
-Tim

it does, pretty much outlines how I was planning on getting around it too!
(someone's reading minds here!) Great! Hopefully I can nab a few more bytes
from the code at $E453 and include it in my routine... hopefully being able to
change a few bytes at $E453-$E455 to just jump to my routine automatically
just in case there's a DOS-reference I've missed! I'm hoping for an end
"program/product" that I could load up from DOS, swap a couple drives, then
run a warm boot to load up some general software (commercial games/disk
editors/recovery programs)! I know a jump to $E477 or $F125 will do a full
reboot, but isn't there another location I can jump to for a "system-already-
reset-just-reload-dos" type of thing? (This IS called a warm boot, right?)

Ugh. I thought this was an option available to MY-DOS... apparently not. Well, it's still better than TOP-DOS, I think. I used to use the "latest" version of TOP-DOS, you know, the general-support-for-everything-ever-produced-DOS, but it was a big memory and disk hog. EXCEPT, if I wanted to split my "192K" ramdisk up, NO PROBLEM! 3 ways? NO PROBLEM! 4 odd size drives? SURE!

How do you do this in MY-DOS? Anyone? Is there another program I need to have to patch MY-DOS? I'd like to at least set my Ramdisk up as 2-90k drives on occasion for rapid disk swapping/editing/disk compacting!

Anyone hear something further on the MY-DOS 4.6 release date? Is it still coming? Hopefully??? Is the max-disk size the only thing to be changed? True 3 or MY-DOS 4 digit free sector counts? (I tried the 3-digit patch for MY-DOS 4.5, but get garbage over 999 sectors and frequent empty lines, etc. even when UNDER 999 sectors! (DOS 2.5 would show 999+ sectors)) Is this sub-dir filename bug finally dead?

-Tim

514. Sio2pc Emulated 850?

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-12 04:24:00 UTC
From: Glenn.Saunders%f204.n330.z1@fidonet.org

Source record: 103195

I think it is possible to use SIO2PC to run a bbs, but it isn't as fast
as a hard drive.
The newest SIO2PC supports 50K baud data rates.
Plus, your BBS software will have to be able to run with the SIO2PC
handler loaded.
And I hope that SIO2PC is flexible enough to allow note and point
through the files.
The more "virtual" it is and the less physical the drive, the less apt
it will be to run with something
as disk intensive as a BBS program.
Loading and saving programs is different from noting and pointing
through spartaDOS.

As soon as you allow a PBI flow through and 1 meg of banked Ram I think
your Yorky will become popular.
Most Black Box users miss the 1 meg MIO ramdisk.
The Yorky won't support Antic Banking, but for BBS sysops, it would be a
great simple add on for a ramdisk.

Source record: 103198

Please upload the unZipper so it can start to circulate and be tested.
There are programmers who, with your permission, could build on your
work or help you out.
With a zip unzip that could handle only text should be sufficient for
8-bitters who want to use QWK doors.
This would be a big help for users who don't have QWK doors that support
.ARC.
I was one of those users until recently I found a good board that
supports PkARC.

There is an "impossible" 800 upgrade that banks a little 4K window to
add up to 64K.
But I don't know of any good way to get it truly XL/XE compatible.
Short of replacing so many components that it pretty much IS an XL/XE.

^^^
> Any idea what that translates to in U.S dollars, Canadian, or U.K pounds?
> Any news of the floppy controller yet?

Not *500* Marks, I meant 50 German Marks. At the moment you can get
for one dollar about 1.7 Marks, so the price would be about $30 plus
shipping.

I don't own both of them - Turbo-DOS doesn't support my 3 1/2 inch
drives and SPOS doesn't care about my ROMDisk (this will change in the
near future). Turbo-DOS uses command lines, and has several nice
features (e.g. D:ABC- would be the same as typing D:ABC*.*), but is
very compatible to DOS 2.5. Of course it uses Ramdisks up to 256K.

SPOS was mainly designed to be used by game freax - the freezer allows
you to interrupt your game and save it to the Ramdisk (to re-load it
later). It has also a builtin C:-simulator, to load cassette games
from disk. In the near future there will be a function to switch
between different programs (saving one to the Ramdisk and reloading
another from there). It probably has more features, but I don't use
it!

Bye,
Jochen

522. [--- What is METAL ? ---]

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-12 12:46:18 UTC
From: winston@merk.com
Message-ID: <CL43H9.HnB@merk.com>
Source record: 103203
Cross-posted to: comp.sys.apple2.programmer,comp.sys.atari.8bit,alt.bbs.metal

What exactly is METAL / FUTUREVISION ? I take it that it is a combination of Programming Language and BBS that runs on an APPLE II ? The posted code examples look surprisingly like BASIC, so much so that I am wondering what the requirements for the BBS would be. Could any 6502 8-bit machine with a BASIC and about 48K of onboard RAM have a reasonable shot at supporting a METAL BBS, or is it mostly APPLE-][specific? The reason that I ask is that most of the 6502 8-bit machines have been orphaned by the wayside. I was a long-time reader of the old CREATIVE COMPUTING magazine when the editor was David Ahl (editor of the book -- BASIC COMPUTER GAMES). I remember a time before advertisers and publishers decided that it would be a real peachy kean idea for every machine to have its own magazine, a time when all 8-bit owners were brothers and NORTHSTAR, and CBM PET, and ATARI, and OSI CHALLENGER, and APPLE folk did not wage flame war on one another. The 6502 8-bit machines -- taken collectively -- have got to total around the same number as original IBM XT owners. There are over five million C= C64 owners in North America, probably a half-million ATARI 8-bit owners, who knows how many APPLE-][s languishing in Elementary Schools and supply closets. There has to be a way for all of these now fragmented groups to come back together. A common BBS that could run on as many 48K 6502 8-bit platforms as possible would make a great catalyst for a gathering of the outlying clans into a coallescing and once more cohesive unit of 8-bitters, before all of these isolated pockets whither on the vine, which is the reason why I ask this question. (Then there are the APF-Imagination Machines, the MATTEL Aquarius users, the COLECO Adam owners, the..., etc., etc., ad infinitum.)

My source (DDJ) says the LZW method uses tables of strings similar to a
dictionary/spell checker with codes replacing the strings in the compressed
file. It's when you get to the 13 or 14 bit encrypted files that these tables
get to
large for the 8 bit to handle easily. I'm guessing it's equiv to having
a dictionary with 13^2 or 14^2 entries. The code itself is pretty vanilla.
My guess is something like CC65 would eat it up including the {}.

528. A/D

RE: hanging A/D on the bus. I talked with Wooley years ago about it, at the time I was doing serial 8 bit A/D with a TI chip using the joystick (what else <sigh>) port. At the time he said the way to do it was through the cart port. One hard head and 3 years later I'd switched to the National Semiconductor ADC831 chip. Still serial, but a really neat chip: differential imputs so you divide 5V into any range i.e. do things like 1.5V to 3.0V in 256 steps. The thing will do something equivalent to a 20k sampling rate. The part is available from JDR Microdevices @ $5.
Needless to say, Wooley was right. I couldn't get the joystick port to clock properly at 100 kHz for the chip so....
Added a 2nd 6520 to the bus which cleaned up the signals rather nicely & hung the ADC831 onto that. Now the bad news, fastest you can sample & store data is just over 5 kHz because of the 1.79 mHz 6502! It was still good enough that I added a 3rd 6520 to the bus with a resistor D/A ladder for stereo 8 bit sound, BUT no matter what I won't be able to get the sampling rate up for the intial sound conversion without a hardware kludge to the existing design.
Wooley is still right.
I'm flip-flopping on what I should do with the design right now. For instance, if I continue going forward with the thing as a 8 bit 8 bit <sic> stereo it will have lousy reproduction because of the low sampling rate. If I just tie the D/A of the 3rd 6520 to the range & span adjustments of the ADC831 I can have a something like a 24 bit A/D 0-5V converter that can sample at 5k/sec. Impressive but totally useless. The RFI noise from the computer completely drowns out anything over 8 bits. Punch line is if any body needs some data on this chip just let me know, I have the NS data book for it as well as their other A/D stuff. I may look at sound with it again, but it's going to need stuff like a 74ls164 serial to parallel chip added to take some of the load off the 6502 if it's going to get fast enough to do anything really useful.

Sorry I didn't put this in the original thread on A/D, lost it <g>.

>I think it was incompatible with something else he wanted to run when he was
>home. I expect he will post a follow-up and remind me what it was. The
>information might be useful to someone else here as well!

Rather than the Axlon product, we have a memory expansion board from
Mosaic. In particular, I think we had the Mosaic 64K RAMSelect
board, plus two Atari 16K boards for a total of 96K. We took the
Mosaic board out because a) Syn-Calc is the only thing we have that
recognizes it, and we don't use Syn-Calc anymore, b) We got tired of
using the KBoot program to revert to 48K for incompatibility problems,
and c) I thought there was something that just wouldn't run with the
Mosaic board in there, but I don't remember what is was now either.

What's in there now is the standard 3 16K boards for a total of 48K.

In article <CL43H9.HnB@merk.com>, Winston Smith <winston@merk.com> wrote:
>
>What exactly is METAL / FUTUREVISION ?

Metal is the language that the bulletin board software (Futurevision)
was written in. Here's the info-file for Metal:

METAL - Mega-Extensive Telcom Applications Language - is designed to give the
SERIOUS sysop the power that, until now, has been lacking on the Apple][
series.

METAL gives the sysop:

o 24-bit integer math (-/+ 8meg range).
o An upper limit of 8 megabytes on any compiled program.
o Variable memory that takes advantage of your computer - 37k for an Apple
//e or //c, and 64k or 128k for the Apple //GS.
o Full 2-dimensional array support.
o Massive command set - Allocate, Memstring, Do/While/Long If, Abort, Xfer,
Fcopy, Edit, and more!
o 31-character labels, 4-character variables, along with full support for
hex, binary, and of course, decimal.
o Easy-to-use and modify configuration file.
o Fully customizable printer, clock, modem, and modem port interface drivers.
o The local video driver (standard Apple PTSE) can automaticly translate PTSE
control codes to other emulations - your users can even switch emulations
online, and most PTSE commands (include the MouseText character set) will
be translated to what the emulation expects! Totaly transparent to both you
and your users - simply write everything in PTSE, and let the system do the
work for you!
o Documentation on the language supplied in AppleWorks 3.0 AWP file format,
covering the language and commands in extreme depth.
o Over 200 external ML routines for your ML programs to use.
o Sysop creatable "External Package" programs that METAL can use as part of
its own system.
o Three types of externals: Packages, External Files, and Shell Commands.
Shell Commands can be used from the Reset Options locally to do things like
editing a file, cataloging, viewing, and deleting files, even deleting
entire directories!
o Ability to change the size of up to 126 memory areas for your BBS to use.
o Up to 40 "Data Areas" for your BBS to use, ranging from bit-level to
three-byte-long data values.
o Built-In file transfer commands, with protocol support for Xmodem,
XmodemCRC, XmodemBatch, Xmodem1k, Xmodem4k, Ymodem, Ymodem4k, Ymodem-G, and

Zmodem - all industry standard protocols.
o Hide and Unhide variables directly in memory, without any disk access.
o Local labels, extra-long lines (can actually go up to the entire file),
including of common source files, chaning of multiple files into one object
runtime program, definable macro strings.
o Procedures with local variables and input/output variable passing.
o Much more than can be listed here!
o Runs under ProDOS-8, with many features for the GS computers.

Policies for Metal:

The best way to find out about Metal is to become a member of the Futurenet
network; either by becoming a user on a bbs, or by running your own bbs.
If you have Usenet access, you can also read alt.bbs.metal for more
information and support.

Metal is now FREEWARE. TC Wilson (aka Wilson Wares) retains ALL rights.

Currently Metal is being supported by:
Shane Zatezalo, sysop of site #35, The Atomic Playground
Internet/Futurenet: root@tap.colum.fnet.org
Tony Diaz, sysop of site #04, The Space Bar

The only thing I've been wondering, is how does SDX do this while a program's executing (not at the prompt)? Is there a memory-resident module you load that let's you alter it on the fly? Or is it already in memory somewhere?

A friend of mine gave me an Atari 800 without a power supply. Could someone sup
ply (pun intended) :) with the voltage/polarity/amp rating so I can by a replac
ement? Thanks in advance.

536. Who wrote MACH-DOS?

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-13 06:51:31 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CL5Hpw.9zL@utnetw.utoledo.edu>
Source record: 103017

Wow... looking for some alternative DOS's in my collection, I stumbled across an updated MACH-DOS, 2.1 XL to be exact. I thought the only version I had was 1.something... nice! Anyone know who wrote it? It's claimed by STACE 1984. Where's S.T.? (S.T.Atari.Computer.Enthusiasts)

I wonder if they ever put together a ramdisk option for the DOS!?! This thing runs pretty clean, good screen layout, etc.! And it uses the old 3-digit sector format old DOS-based programs (such as AtariWriter) love!!! I've tried the 3-poke hack to MY-DOS, but it's caused other problems, as a couple others pointed out long ago... shoot... had to try it myself though! I've experimented with N-DOS, Dos 2.6, Rana-Dos (known by other names also), TOP-DOS (several versions), Gardner Dos, 2.5, 3.0, 4.0, 2.5+, 2.0m, and good old 2.0s... not to mention MY-DOS and Sparta which are both incompatible with my poor AtariWriter cart. I've just so recently bought via mail. I'm sure I've missed a couple more DOS's as well, but in short, nothing's covering my needs.

Has anyone used Turbo-DOS, just recently brought up in discussion in the newsgroup? How about Superdos? Both are from overseas I believe. Superdos was marketed by a California company a couple years back though. Both have [1] ramdisk support and [2] atari dos 2.0 TRUE compatibility (or so I'm led to believe). Any other decent RAM-DISK using DOS someone out there in net-land can think of??? Please, I'm looking for something to use for all my future disk I/O formats and storage!

(And yes, I'm keeping an open mind to SpartaDos-X... I may just get it for general disk use and be "trapped with" dos 2.6 for AtariWriter. BUT, if I can find a good general-purpose DOS with RAMDISK (256k, 128k, XE/RAMBO and AXLON usage) capabilities and DOS-2.0 compatibility... well, HERE I COME!)
-BTW: For those interested, DOS 2.6 is the BEST single-density DOS I've come across with full 2.0 compatibility. Anyone know if a double-density mod or new version ever came out? (hex conversions, sector quality checks, rpm tests, sector copying of SPECIFIED sectors only, etc. ALREADY! ... NICE!)

What DOS's do some of you have/use? Good points? Bad points? Available on the umich archive for ftp? Still supported by the author? Are you the author? English menu(s)/features?

-Tim

(Mr. Glenn Sanders suggests uploading unzip stuff.)
I don't know if you are referring to me or to the guy who did unshrink. I'm still ironing the bugs out of what I've been working on. I have a large 'C' source, but you could obtain that the same way I did. Anybody interested in working on this project, I'd be glad to talk with you about it.
What I have so far is an overall signature and header reader and an unimploder. I still need to work on it considerable before it would be ready for someone else to use as a shell. It is/will be a way to work on unreduce and unshrink. Just eliminate the unimploding code and it would then allow working on one of the other methods.

>handler loaded.

There is no handler to be loaded on the Atari.

>And I hope that SIO2PC is flexible enough to allow note and point
>through the files.

It is. In fact, SIO2PC has no notion of files, only sectors.

>The more "virtual" it is and the less physical the drive, the less apt
>it will be to run with something
>as disk intensive as a BBS program.
>Loading and saving programs is different from noting and pointing
>through spartaDOS.

I think you don't understand SIO2PC. From the Atari side, it plugs in like any other device and responds to the exact same signals as a disk drive would. The only special software that's required is on the PC side, where the signals are interpreted and the correct responses are sent.

BB>And by the way, Lance, yes, the 16-bit versions are supposed to be really
BB>nice. I think John Harris has already gone over all the added features.
BB>Sheesh, if we can make this a simple and cheap enough upgrade (as in if
BB>somebody will make and sell a little upgrade kit) we might see it in a
BB>significant portion of the remaining atari community's machines. That
BB>would be cool, but I'm not holding my breath. Christ, how many people have
BB>done the stereo mod?

I think the idea of using a 65816 or 65802 is one whos time has come.
If we can't push the mhz then maybe we can push for better efficiency through
the newer features/opcodes of these chips. Adding the 24 bit addressing
electronics to make a T816 workalike is not really viable for the average
hacker, but yes, if someone makes a simple board and writes up a text file
I can very well see this catch on, as long as all the new opcodes and stuff
are available in 8-bit emulation mode so that a custom OS would not be
necessary.

There is also a slight compatibility issue to discuss. There is a feature
of the 6502 that has something to do with number rollover which is used in
Synfile and such which I think is treated differently in these newer chips.
This would be something that would be impossible to reconcile. Anyone with
a lot of 65C02 or 65816 experience should shed some light on the compatibility
issue.

I think it is quite possible that the 65802 could expand our horizons.
I also think the stereo mod may become more popular if that audio effect
program actually gets written I've heard about, where you can add effects
to guitars or other sounds.. Sounds awesome!

JS>press START, or moving a cross over the screen and pressing fire? :-)
JS>Marek Tomczyk is the inofficial translator for the game guides - if
JS>there are enough English speaking people buying these games, he would
JS>probably translate them into English, too ;-)

Since my initial reply I have found a "source" for Operation Blood and other hard-to-find European games. I question the legality of this "source" but if it is the only way to get the stuff, so be it! If it could be brought in legally that is fine. As long as the companies involved are still in business and give a whoot about the rights then I would respect those rights. However, if they don't plan on importing the games, then that won't stop me from getting them, as it didn't stop people from picking up Draconus and Zybex as if they were public domain.

I think what we really need is a list of games and their status, whether it be PD or commercial or grey-area. When I see these games listed in a catalog I have no idea whether they are commercial or not since they were sold half-way across the world. This lack of information obviously allows for much easier pirating, even unknowing piracy.

JD>IMHO, it wouldn't hurt to move on beyond the XEP80, which never got out
JD>into the Atari community in big numbers, anyway. Any new device that
JD>FTE designs could take advantage of better technology than the old mono-
JD>chrome-TV-without-a-tuner monitors most of us have tried to use for 80
JD>columns on our 8-bits. The Atari SM124 monitor from the ST world is
JD>commonly available on the net used for around $75, is a crisp black-on-
JD>white display, and even includes a speaker. Compatible devices are
JD>still being produced for those who wish to spend more. To make the 8-
JD>bit viable on into the late '90s requires a decent, inexpensive 80-
JD>column display and the software to use it, so any new device such as I
JD>have described must work with what little 80-column software exists,
JD>particularly AtariWriter 80 and an 80-column term program. I'm a real
JD>cheapskate, but I'd be willing to spring for $75 to be able to hook one
JD>of my old SM124s to my 8-bit.

The problem is that there is a serious logjam in data throughput through
the joystick port. To me, any new 80 collumn device should at least be
CGA color compatible, and would most likely hook off the cart port or PBI
port (pass through of course). XEP-80 emulation mode with a separate redundant
joystick dongle is posible I guess. That would be the ideal in my book.
Only by moving to a faster port, or a DMA port, can we get fast 80 collumn
terminal performance, and word processing would be much easier and faster that
way too.

SP>when all I need is a floppy board type add on. It is my understanding that
SP>you must have a black box to use the floppy board. If I am wrong PLEASE
SP>tell me since I would LOVE to have a floppy board alone.....

Yes, you need a Black Box to run a floppy board. The HDI sounds good.
Hmm. I forget what the price translated to in american dollars.... That
is an important consideration. I'm going to wait and see what other con-
cessions may have to be made to run the HDI, no custom OS, but perhaps a
custom DOS? Ever since the dawn of high speed SIO there have been custom
DOSs like Happy DOS and DOS XL for synchromesh. If it is transparent to
Sparta or MYDOS then it will get MY seal of approval.

Ben, I realize you have been in tough straights lately, but I wonder whether you can clarify something. I sent in a renewal months ago and have not received the AC issue (December?) with the new video mods in it. This was the first and only issue that I have missed so far. The upcoming issue isn't here either but noone has that yet. Could you check to see if you have my renewal notice on file, it is quite feasible that the renewal was received at such a late date that I was no longer eligible for the December issue, but I would like to know because irregardless I wouldn't want to miss that issue, whether I have to pay a backissue fee or what have you.

EXACTLY!

The only limitations are the limitations of the PC software. Right
now, there's no way to tell the PC to pretend that certain sectors are
bad, or to control timing on various tracks, so you still need a drive
if you're running copy-protected software. The program for the PC was
written in assembly, so it's not easy to modify.

I don't care.... most of my files are downloaded PD progs.

so will I be able to start right away? are there readily available disk
images with bootable Dos and SpartaODS, are there utilities available to
import MS-DOS files into a disk image (well duuuuhhh), and further,
will I be able to write to disk images with Sio2PC?

I think there's some disk images with DOS available. Yes, there is a
utility for mounting a PC file as disk that contains that file--it's
awkward, but it gets the job done. You create the raw image files on
the PC, but you format them (putting in the directory and boot sector
info) and write files into them from the Atari. You should probably
FTP a copy of the program and documentation from the archive.

If there's further discussion, we should probably carry it out over email.

Is there any source in assembly? I thought about trying to encode some kind of compression algorithm to use from within an 8-bit bbs, but I'm only vaguely familiar with C, and C really doesn't seem to be a very viable option on the 8-bit anyway. I found some Z-80 source (CP/M) for UnARC, but none for the actual compression. Assembly (of nearly any kind) would be more useful to me than C.

BTW, did DataQue ever release the TC8 C compiler they were working on?

Why would the programs in question differ between a 1050 w/ a
Happy mod versus an 810 w/ a Happy mod?
I have 810's and 1050's with the Happy mod and all the
Happy produced copies don't care which one they run on as
long as the density is single density.
For instance, a copie of Atari Planetarium will not, of course
run on the 810 since the disk is not single density.
Do the EA programs contain code that detects a 1050?
Or do they detect the Happy mod somehow?

555. Re: Fine Tooned Engineering

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-14 08:27:49 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <Ra3rt71.lmcclure@delphi.com>
Source record: 103036

Jeff Potter asked:

"Okay, who has some timing specs (vertical, horizontal scan
frequency, or range, etc.) for these monitors?"

According to the Rev 9 Best Electronics catalog, the SM124 scans at
35.7Khz horizontal, and 71.2 vertical.

"If these can scan at near 15.75kHz Horz.,we might have a
chance. Anything much faster requires either a mod to the
monitor (ouch!) or an extensive h/w project for the 8-bit."

As mentioned above, it does not. However, I believe the original poster
was requesting an XEP-80 replacement that worked with this monitor,
not adapting it to be used as a "native" monitor for the 8-bits.

With a small timing change, one could also use a monochrome VGA monitor
(standard VGA rates are 31.5Khz horizontal, with 60Hz for 640x480
graphics mode, and 70Hz for 720x400 text mode). VGA mono monitors are
more readily available new, but are typically over $100, while the SM124
are often available used for under $100, and include a speaker.

A second monitor or TV would have to be used to support the standard
8-bit video output.

Eric <palm_erd> said:

"I wonder if it would be possible to hook up the SIO2PC in
this fashion 8-bit > SIO2PC cable > 14.4K modem (set to
autoanswer) > PC running SIO2PC hooked to 14.4K modem."

If I recall correctly, the SIO2PC connection is much faster than
14.4Kbps. However, if the SIO2PC supports hardware handshaking, it
should still work by setting the modem's port rate to what SIO2PC
expects. If it does not support hardware handshaking, one could
concievably overflow the modem's buffer with outgoing data from the
Atari 8-bit.

Oh...and you would almost certainly need to rewire the SIO2PC
connector or insert a null modem adapter, since the SIO2PC cable is
set up to talk to a PC's serial port instead of a modem. (Just as you
need to use a null modem adapter when connecting a PC to another PC,
as they expect to be talking to a modem instead).

Ivo van Poorten said:

"I thought of putting a WD1771 (same one as inside the ST)"

<nitpicking mode on>

Actually, the ST uses a 1772, which I believe is also used in the XF551.

<nitpicking mode off>

Since the 1772 does not properly support hi-density (Atari designed and used the 1772-compatible Ajax chip for that), essentially you would end up with the same type interface as the XF551 motherboard.

For high-density support, you would either need to overclock the 1772 (not the most reliable approach), or find a sufficient supply of Ajax chips, or use a totally different drive controller chip.

While I, personally, would prefer the use of an Atari SM124, I can
also see the usefulness of a mono VGA monitor.

]A second monitor or TV would have to be used to support the standard
]8-bit video output.

Yup. I would think the usefulness of the Atari 8-bit would be greatly
extended by being able to easily set up a system with two monitor: one
standard color monitor for playing the great 8-bit games, and one mono
monitor (either SM124 or VGA) for 80-column text for more serious ap-
lications, such as word processing and telecomm. With this setup, many
of us would never have cause to want to move on to another platform. I
realize that something rather like this is aleady possible with the old
XEP-80, but the problems are that a) the XEP-80 wasn't produced in num-
bers sufficient to support many of us or to cause saftware authors to
have much interest in writing for it, and b) the old green and amber
mono monitors I've seen are no match for the crisp black-on-white of my
SM124.

Unfortunately, I seem to be the only one interested in pursuing this di-
rection.

Maybe I missed a few messages, but what you are talking about doing is all possible with the US+ Operating System from CSS and has been profiled in Atari Classic articles very recently. It's a modification to your XL or XE where you install a three-OS chip (800, XL/XE, or US+), after which you can do drive-swapping with any DOS. You press RESET and START simultaneously to bring up a configuration menu. From this menu you can swap drive numbers and move your RAMdisk to any drive. You can copy a disk to your RAMdisk, and boot from it. Under software or hardware control (by installing another switch) you can swap the drive numbers back at any time.

CSS was running a special up to 1/31/94 where the normal ($69.95) price was discounted to $54.95.

I sure like mine! It also allows a bunch of other keystroke commands (like disabling Antic, noisy DMA, etc.), and supports ultra-speed read/writes to modified 1050's and XF551's.

Sounds great! But did he neglect all us faithful 800 users out here?
(ok, I nearly forgot about the 400 users... sorry!) How about 1200xl? I have
3 Atari "PC"s: 800, modified 1200xl, 256k 800xl. The 800xl is nice... but...
I prefer the old typewriter-monster 800 and the 1200xl is setup quite lean -
works well. My big problem is I'm looking for something that'll work with all
three (ie. a new DOS or a "TSR"-like program (VBI)). I was trying to look into
Newell, but they give poor descriptions of their products. I need to talk to
the person who wither made the OS mods there, or one of their lucky buyers...

Although, with the boosted power output, and plans for a 1 meg upgrade to
my 1200xl... wellllll... (this msg is taking forever to write as I dream of
future mods to my system!) I've always wanted a soup-ed up 1200xl with those
re-definable function keys, etc. Hmm. You say this US+ OS works with XL's,
eh? $70.00... grumble... man, he's always been the most expensive 8-bit
supporter... I'll check into it though! (Still want to get one working
myself - it'll take a few hours to put everything together once I get all
info nailed down, but it'll be "free"! Ahahahahaha...heh..huh? Oops...
getting carried away. Spent over $200 in the last couple months on my Atari
already!)

-I knew one of the OS mods already did it!
(Just wasn't sure which one!)
-Tim

PS: How's the incompatibility with the modified OS? Still only runs about 85%
of the 800 software, or has it changed in the last 5 years? Decent ramdisk
support even when in "800 mode"? How about PBI support while in "800 mode"?

562. Anyone using the Syn-series?

MORE SUPPORT FOR YOUR 8-BIT FROM RICHARD GORE

HARDWARE.

The Yorky 256k plug in memory upgrade for the Atari 800/600XL computers.
This memory upgrade simply plugs into the PBI port on the back of your XL
and gives you 256k of bank switched XE compatible memory. It is supplied with
a printed manual and a disk of support software.

Current price is #50 (UK pounds) plus #2 shipping.
#5 shipping if outside UK

(Current price in US dollars including worldwide shipping = $85)

A PBI feedthrough port is completed, we have tested it on the Rambit PPP
printer interface and all works well - now all that remains is for testing on
a Black box. Once testing is complete I will announce the availability and
new price structure.
Rambit (a company run by a friend of mine) have available a printer
interface that plugs into the PBI port and also the knowledge and schematics
for interconnecting two computers via the PBI. I will post more details as a
service for Rambit when I have them.

SOFTWARE

Due to a really pathetic level of support from the community (ie zero sales)
we have decided to create a double pack called 'Maze Mania' featuring two
games (details below) and offer them at a give away price. The two games are:

1) JAWBREAKER Guide a pair of chomping teeth around a maze eating as much
candy as you can, but don't forget that important dental
hygiene. This package includes two separate mazes originally
sold as individual games as well as a pause function.

2) MOUSEKATTACK Plumb all the levels of Rat Alley but watch out for those
giant rats. Classic arcade action for one ot two players
(on screen at once) with improved joystick control and a
pause function.

This double pack is available NOW on disk, tape or Rambit Turbo tape!

PRICES: UK (inluding p&p) #6.95 per pack.

Worldwide (including shipping) #10 or $18 per pack.

** REMEMBER YOU CAN NOW GET TWO CLASSIC GAMES FOR ONLY #6.95 **

We also have several more games in the pipeline - more details will be released when we are closer to their completion.

* *
If there are any software authors out there with products finished or nearly finished we would be very happy to consider marketing them. This applies to new software and old games so long as you have the rights to them.
* *

For more details or to order write to:

Richard Gore, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

or e-mail RG9@UK.AC.YORK.VAX or RG9@UK.AC.YORK.TOWER

(for those outside the UK you may have to invert the uk.ac.york.xxxx)
(part to xxxx.york.ac.uk)

Telephone enquiries can also be accepted over the weekend period from 7pm on friday evening to 4pm on sunday afternoon.

In the UK phone (0302) 784642, outside the UK refer to your phone book on how to dial internationally, and ask for Richard.

Well, if you really want a souped-up 1200, get in touch with Bob Woolley (75126.3446@compuserve.com). On CIS he's reported that he modified a 1200XL for someone that included:

a Black Box
the US+ OS
an IDE hard drive (inside the 1200 cabinet)

When I switch to "800 mode", I have yet to find a piece of software that wouldn't run. The "Gorf" cartridge, reputed to be 800 only, runs like a champ. I haven't tried RAMdisk support in 800 mode, or PBI support. Anything that wasn't known to the 800 OS, like PORTB control of OS ROM and banked memory, probably isn't supported.

Prices do not include shipping. Add $2.50 for a single item, $4.00 for 2 or 3 items, $5.00 if you buy 4 or more. I think the prices are very reasonable, so buy now!

Epyx LucasFilm Games
BallBlazer $10.00 Disk, complete package
Koronus Rift $10.00 Disk, complete package
The Eidolon $10.00 Disk, complete package

Accolade
Ace of Aces $10.00 Disk, complete package
Fight Night $10.00 Disk, complete package
Hardball $10.00 Disk, complete package

Mindscape
Infiltrator $10.00 Disk, complete package

Infocom
The Hitchhiker's Guide $10.00 Disk, complete package
to the Galaxy

Broderbund
Stealth $10.00 Disk, complete package

Fisher Price
Memory Manor $5.00 Cart, Box, no docs
Logic Levels $5.00 Cart only, no docs

Atari
Food Fight XE $10.00 Cart only, no docs

Activision
Keystone Kapers $5.00 Cart only, no docs

Atari Archive: 8bit/faq2.txt

All Known World-Wide 8-Bit Atari Vendors and Developers

A Companion to the Atari 8-Bit Computers FAQ List

Revised 5-Feb-94

This file is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion
group on the 15th of the month. A fairly recent copy is kept on the Atari
Archive as the file 8bit/faq2.txt, but the most recent copy may always be
requested from mcurrent@carleton.edu.

The main portion of the FAQ List is posted to this discussion group on the 1st
of the month, is called 8bit/faq.txt on the Archive, and is also available from
mcurrent@carleton.edu.

Please send updates to Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

This list won't be complete and accurate without YOUR help.

Developer: Atari Tape Backup Program

When writing to request catalogs,
it's always a good idea to include
a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing
a couple of International Reply Coupons (IRC's).

I know this msg wasn't actually meant for me, but you won't have to upload it
to a.a.u.e because it's already there. I just checked it at a mirror site
somewhat nearer and I found both zip and unzip sources at src.doc.ic.ac.uk in
/packages/atari/umich/Archivers/Unix. They are called zip19p1.zoo and
unz50p1.zoo. These are the sources of all ports of Info-ZIP's zip/unzip
which is based on S.H.Smiths unzipper...

Hope this helps,

IvO+> van Poorten

Well hell, it should be possible, I mean the SIO2PC handles rerouting D:
and P: calls, why not R:!? It'd maybe take some hardware hack, or you
could somehow make an R: handler that talked to the SIO2PC, or you could
make the SIO2PC software direct D: or P: read/write to a modem!?

WHY HASN'T IT BEEN DONE!? :)

Peripherals for the 8bit!? Heck no! hook it up to your PC! Of course,
this may reduce the market for Black Boxes, but that's only to those of us
(hah) with IBM "machines" ;)

WHAT!? WHAT!? I've been in and out of reading c.s.a.8 lately cuz I've been
doing it from odd software, but what the heck are you talking about, MyDOS
4.6!? I didn't even realize 4.5, etc. was still "officially" being
supported. I guess I sorta figured nothing was going on with MyDOS anymore
(upgrades, etc.)...

COOL! Gimme details, someone! :)

THANX!

(BIG MyDOS fan :))

576. Print buffers,switch boxes etc. for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-15 20:06:45 UTC
From: cohen@GOMEZ.phys.virginia.edu
Message-ID: <0097A19C.BE131200@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 103056
Cross-posted to: comp.sys.apple2.marketplace,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.tandy

Switch boxs, print buffers for sale-

1. Quadram Microfazer Serial/Serial 64K buffer; has reset and copy buttons, ready, error and copy LED indicator lights; comes with a power cable with an external little transformer that plus into the AC wall outlet.

3. QVC parallel print buffer, 64K, practically new (used only once, to test it!) in original box with manual. Has a lot of buttons and lights, for copy/stop/ bypass/resume/test (etc.). This print buffer has Centronics connectors, and I can send a Centronics/Centronics cable (to be used to connect the buffer to the parallel printer) if needed.

4. Black Box A/B/Switch box for parallel printer, with 3 Centronics connectors on the back. Supports 2 printers connected to the same computer (e.g., one printer for drafts and another for letter quality, or one loaded with computer forms and the other with single-sheet letterhead paper). I can supply the pair of centronics/centronics cables used to connect the box to the printers, if needed.

5. MP-401B AUTO DATA Switch parallel printer automatic sharing device.
Four computers to one printer (parallel) auto-switch:
Supports 4 computers INPUT - one printer OUTPUT. DB-25 (IBM PC style) female connectors on back, for use with parallel computer printer interface. Comes with a power cable with a 9V small wall transformer that plugs into the AC outlet.

I would like to sell to best reasonable offer. Please respond via e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU or call (804) 293-8973 . Thanks!

(I. van Poorten gives location of unzip and zip sources.)
Thanks. Mr. Tomczyk can get the Info-zip files if he wishes. They are about 1/2 meg each (unzip and zip) of 'C' source that I have not gotten in to much. A bit overwhelming. Mr. Smith's 1987, 1989 Pascal source is clear and easy.

578. help with CAVELORD!

Message-ID: <1994Feb15.213722.1@csusys.ctstateu.edu>
Source record: 103059

I can't for the life of me get CAVELORD to run on my 130XE. I am using the SIO2PC cable to format a 'fresh' 90K disc image. I unarced the file CAVELORDS.ARC that is on a.a.u.e. under /8bits/Games. I transferred with binary, downloaded it to my PC, ran the SIO2PC software (v3.15i) I booted MYDOS and ran SUPUNARC. The archive dearcs fine, just it won't do anything after showing the title screen. I've tried with and without Basic, I've tried the translator disc with and without Basic. I even tried DOS 2.5 Is this one of those strange games that will only work with DOS 2.0? I may never know as I don't have DOS 2.0 anymore. I searched all of my discs, and all DOS 2.0 discs have been replaced with DOS 2.5 Sh*t.

I believe you also lose the XL graphics modes. This is true on the
version I purchased in 1985. (about). As far as compatability, I've
had very little not run on it, ecept possibly Microsoft Basic (the
first disk based version). and I'm not sure the disk is good.

> with outgoing data from the Atari 8-bit.

The current SIO2PC software goes up to 38.4k when running
SpartaDOS with UltraSpeed, normal operations are at 19.2k.
Those are standard speeds on most PC serial ports.

> Oh...and you would almost certainly need to rewire the SIO2PC
> connector or insert a null modem adapter, since the SIO2PC
> cable is set up to talk to a PC's serial port instead of a
> modem.

This is the point, all that's needed is different software.
The software would 'connect' the modem on COM2 to the Atari
on COM1, say. It'd probably need a somewhat fast computer.

It's not too outlandish. The software as it stands today can
intercept the Atari's print output and redirect it to a PC
printer.

HEY ATARIANS!!
I need some help!!! I just came into possesion of a 65xe and there was no documentation with the computer except for some docs that were to a couple of the game cartridges that came with the machine.I need to know what kind of floppy drives might still be available for this machine and if there is still a mail order house out there that would still have any drives.If someone knows the model numbers for drives that will work that would be a big help.Does anyone know if extra ram can be added to this machine and where you can get the upgrades?What about an atari support magazine still in publication.If there is one,what is there address and what does a subscription cost.Does anyone know if there is a way to get an I.B.M. type drive to work? Any info on manuals hardware,software, and users groups would be a big help as I have nothing to go on and the nice form letter I got back from Atari informs me that they dont support these 8-bit machines anymore and I think that is a shame! If anyone can help please drop me some e-mail.....

Thanks Again
Rusty Rogers

I have both Miner 2049'er and Bounty Bob Strikes Back! and the latter is a similar but vastly improved game. Here in Europe it was released on disk and tape but required 64Kb to run so only worked on the XL/XE series. I dont remeber anything about a limited production run here, and I'm guessing now but Miles Better Software, Page 6 Publishing or Gralin International here in the UK might just have a few copies left.

Hope this helps.

Graham

I have Miner 2049'er also and would love to get 'Bounty Bob Strikes Back'.
If you have people standing in line to sell you a copy, send one of them
my way. :-)

The question has been asked here on the net before and at least one person
said that they actually had the cartridge (I had thought it was only
released on disk) but that they wanted to keep it.

Still looking for 'Bounty Bob Strikes Back'...

There's a big discussion going on over in comp.sys.ibm.pc.games.action
about an emulator for the C64 that was posted on the newsgroup. I'm
considering obtaining a 1541 drive and buying some games for it
(Archon, pitstop, etc) but I'd much rather use my own software and
my Indus GT drives...

Oh yes, the sequel to Miner 2049er. Has to be one of the most
sought after carts ever made. I've never seen them for sale,
but we still hope.

Perhaps we should search for Bill Hogue (the author).

SIO2PC certainly could redirect IO from the Atari port to a modem port,
but the PC on the remote end would not have a means of detecting the
state of the COMMAND/DATA line from the Atari, unless a higher level
protocol was devised to run over the remote PC. For this type of hookup,
it seems to me to make more sense to use one of the existing serial
port LAN packages available for PCs, and just use the remote PCs drives
as if they were local to the local PC.

But I was under the impression that the original poster wanted to
dial up a remote PC with nothing local but a modem and an Atari, with
the modem to modem link substituting for the SIO2PC cable. With this
configuration, there would be difficulty transfereing the state of
the COMMAND/DATA line across the phone line link, although it certainly
could be done by adding (for example) custom microprocessor modem controllers
with some low level protocol to transfer the COMMAND/DATA line sense.
Or, some locally booted Atari software which would implement a slightly
different protocol than the current disk drive one used by SIO2PC, along
the line of the ROM replacements which implement a bootable RAM drive.

I got a ATARI XL with a ATRAI 810 drive and a Mega STE. Now I have access to
the InterNet and I am able to use it to get software for my STE but how can
I get software for my XL or better how can I put software for the Xl I got
from the InterNet on a ATARI 810 disk or is there an other way (i.e. to
connect my STE to my Xl) to transfer the files.
Please, help me. It would be very kind of you.

Thank you for your attention.

>you please post more information about this or contact me directly?
>This sounds fascinating!

I got mine for 50 DM altogether, but this one came together with a fine
case. It is 35 DM without case.

The schematics are very simple: you just connect 2 PIA's to the PBI (or
cartridge port) and that's all. You can imagine that this requires a
major effort in programming in order to make use of it.

There's already a simple E:-Handler that comes together with the interface
as well as a BASIC program playing around with the Hercules-Card.

Theoretically you could connect many different types of PC-cards to it, but
until now only some Hercules-Graphics-Card drivers exist.

I've failed to examine the interface too extensively until now, but this is
mainly because I'm stuck with my TTL->BAS(Composite Luminance) converter.
Maybe it's just my monitor that can't handle the 18KHz line frequecy of
the HGC.

: > it, anywhere? Know where I can buy one???

I thought Americana (US Gold's budget label who rereleased a LOT of good stuff)
re-released this game on cassette. I remember seeing it in a mail order
company's ad a few years back, it was only 3 pounds as well. I'm not sure
why this sticks in my memory- perhaps I was thinking about getting it at some
point, but changed my mind. I've even played it- on the ZX Spectrum. It wasn't
brilliant, but the Atari version may be better.

If you want old games, always keep your eyes peeled for small ads. A lot of old
games are resurfacing... for example, Gralin International have 7 carts on sale
for only 12 quid (add 1.50 for postage), Tennis, Pengo, Mastertype, Asteroids,
Defender, Designers pencil, and Kaboom! Of course not all of them are good, but
if you look out, you might just see that game you were looking for.

'Bounty Bob Strikes Back'
Good luck in finding a copy...I've had mine since it was first released...
excellent sequel..starts out tough and gets more difficult...never could finish
the last couple of stages...This was one of the first bank switched game carts,
I believe ...I don't know how much ROM it has..rumors when it was released were
40k??? I always felt that was why I never saw a pirated/disk version. The
stages/levels all have a more polished look to them when compared with the
original.
On a side note : Until 'Miner 2049' my wife could care less about video
games. The original 'Miner 2049' was the first game that hooked her in. I would
find her at the joystick sqishing those 'brainies' as she called them,while
attempting too be the first to complete a particular stage/level when I came
home from work..."Hey where's supper"...'Sorry, I'm off saving the world from
these radioactive brainy things'...

It didn't sound like it would be too very involved. The main work would be in the software to activate the control registers, etc. in the Hercules card.

|> There's already a simple E:-Handler that comes together with the interface
|> as well as a BASIC program playing around with the Hercules-Card.

I imagine the BASIC program is decipherable...is the E: handler source given?

As a general question, does good documentation exist for the Hercules card, or for any other PC graphics board? I'm talking detailed descriptions of what register addresses do what, not just the simplified layman's docs that tell the average dumb PC user how to turn on his monitor.

609. JVIEW!?

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-17 22:06:33 UTC
From: guest@sonoma.edu
Message-ID: <guest-170294140633@d19b_lab.sonoma.edu>
Source record: 103090

Jeff!?!? I'm wondering about the status of JView, if it's been release (I haven't seen it anywhere) and when and if it actually ever will.. Also, what exactly can it handle? I recall you saying something about using modules cuz 24k (RGB) files took up a little too much RAM for all the features you had planned (what are they by the way!?!)

I've been out of the 8bit arena for a while cuz of winter break and no $$ to resubscribe to _AC_ :(:(:(, but I HAVE been doing stuff, and soon will hopefully be hooking up an SIO2PC to a little cheap PS/2 25 machine so I can have more than my current <512k of drive-space online at a time... :)

anyways, if I missed it and you dont feel like reposting, just direct me to where the info sits.. hey, why don't we (us programmers who tend to yell about our works before they're availabe <blush>) put up text files in some directory at the Atari Archives announcing and/or advertising release dates and info. so there's always somewhere to go and find info like that (other than c.s.a.8 which fills and old stuff gets deleted often)

anyways... ill shut up... im not making much sense as usual :) ....
later
thanx in advance!

I've been thinking about the same thing since I got my SX. It shouldn't be too hard. Simply plugging the IBM serial interface into an 850, P.R., Black Box, or MIO RS232 should work. Any kermit program should be able to allow data transfer between the two. I've also read somewhere you can get a program for the SX that permits it to UL/DL using the X-modem protocal, but I haven't seen it. A good place to check would be at comp.sys.hp48. You can get ftp site addresses from there as well for programs for the 48. I've always wanted to use my 8 bit for archival purposes. Good luck and keep me informed on your progress.

I don't know. I wasn't really working on it. David asked for any help in locating mods and I merely scanned through all the ZMags I had available to me at the time (which was before the collection on Freenet became complete) and made note of the ones that had mods in them. I sent all of the information I had obtained to David, but it seems that the project died out. I sent David some mail a few months ago and it went unanswered (I don't rememeber if it bounced or not). My guess is David no longer has net access and the project is history. I'm including the information I sent to David here for those interested.

>so there's a BIG border around it. It's WAY from being completed and I
>have to say that I can't even remember it exactly... :)

640x480x256? Oh that makes sense for a 320x200x256 computer.

but then again, the Atari can use what we Amiga users call "overscan".
Commodore can't, making their emulator much easier.

BTW, if you say DLI's are impossible, the Commodore 64 emulator does
rasters... but you have to tinker with some settings before they work
exactly right.... it's not finished either.

621. 3rd (or 4th) Mydos bug report...

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-18 23:39:37 UTC
From: timuszyn@jupiter.cse.utoledo.edu
Message-ID: <CLG1q2.653@utnetw.utoledo.edu>
Source record: 103102

I wanted to followup to one of the other mydos-bug articles, but both have expired here. Anyhow, found a down-right NASTY bug that kills the whole idea of my-dos being DOS 2.0 or 2.5 compatible! No, not the major drawback of the 4-digit sector counts, but an actual read/write error!

A few days ago, I copied some old files from a dos 2 - era disk over to a single sided, single density my-dos disk, using dos 2... now I find I CAN'T DELETE THE FILE USING MY-DOS! What gives!?! Seems you can't mix and match DOS 2.0/2.6/2.5 and MY-DOS AT ALL!!! Argh... man, this dos is getting on my nerves.

I'm currently in the market for a new DOS. I'm willing to spend $20 or so (hopefully $15-$25) on something that:
1. supports the 810 SS/SD drive as well as an ASTRA DS/DD drive.
2. supports one or MORE ramdisks
3. supports the dreaded ENHANCED DENSITY formats... always seem to find one of those hideous beasts when you least expect it!
4. supports the 800, 1200xl, and 800xl/130xe machines
5. is DOS 2.0 compatible or compliant at the least
6. yields about 30k work space in BASIC

Anyone see a newer version of MACH-DOS greater than 2.1? How about SUPER-DOS? I've heard promising things about S-D, but it disappeared about 2 years ago and I've heard nothing! Anyone have a re-worked DOS 2.5? Something like a combination of DOS 2.6 and 2.5 with double density support? THAT WOULD BE IDEAL!!! Has anyone else used DOS 2.6? It was INCREDIBLE for its time!

-Tim

PS: PLEASE! I NEED A NEW DOS! grovel...grovel...beg...beg...

I'm the launchpad account. :)

my problem with the 1050s was, we took them apart, we put them back together,
and they don't work anymore... just constant bad sectors. One didn't work
in the first place, the other one worked perfectly but we needed to install
the US doubler chipset. we believe we put the drive mech in wrong.

KLedbetter (kledbetter@aol.com) wrote:
: ps: hmm...wonder how I can get a file to there from this gateway that I'm
: using? (I'm brand new to this whole Internet thing, so be gentle <g>)

Why not... I might as well post a quick Atari archive hints/usage screen:

If you can read/post news as well as send/receive email, you're well on your
way to getting files from the Atari 8-bit archive. If you have FTP capability,
just: ftp atari.archive.umich.edu, log in as anonymous, give your email address,
and that's it! "cd" over to the atari then the 8bit subdirectories and I think
most users can take it from there. There's a "New" directory for uploading
files (please include a BRIEF or LENGTHY .doc, .txt, .idx, or some description
file with your u/l).

(Quick note: if you're new to ftp, make sure you're set on "binary" mode,
type "binary")

If you don't have FTP available, you can always uuencode the file and mail
it to "lenn@mentor.cc.purdue.edu", just give Jody a warning that something's
coming, where in the 8bit (which subdir) it might/should go, and give a few
comments on it. (((For some reason, Jody's email address doesn't look right
to me... is that the proper address???)))

Also, most files on the umich archive are either .arc'd or .dcm'd, depending
on whether it is a collection of files or the entire boot/data disk. Any old
version of ARC on the PC, Unix, VAX, etc. systems will work fine of course.

There's also a way to get archive files auto-uencoded and emailed to you...
but I won't get into that right now. Check out the 0index file on the archive
(in atari/8bit) for the latest dir listing and ftp-by-email comments.

-too tired to continue... need sleep...
hope this blather helped you a little!

640. Two MIO questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-20 10:17:12 UTC
From: eapu207@rigel.oac.uci.edu
Message-ID: <2k7db9$cih@news.service.uci.edu>
Source record: 103121

Hi!

I have two MIO questions:

I have a 256k MIO and I'd like to up the memory to 1 meg. Several years back, some yahoos came up with an upgrade mod. I was wondering if it was circulating still....

Second question is are there any MFM controller boards that you can hook to a MIO that are still sold? I know the Adaptec 4001 (or something real close to that) does the trick.....but can you find those anywhere? That is, in a store, not in someone's closet!!!!

Thanks!!

I know Gorf wouldn't run on my 800XL, and I returned it before I got
a Translator disk; don't know whether that would work or not (if you don't
have a drive, that wouldn't be much good).

>Also, there's supposed to be Missile Command built into this machine, right?

I've been having some trouble copying some old files from a DOS 2.5-formatted enhanced density disk to a MyDOS-formatted double density disk.

The [C]opy command either won't read the ED disk (my Indus gets set to single density, and MyDOS reports an error -- 167, I think), or reads a file from the disk and copies it back to the same disk without prompting for a diskchange (even when using the /X option).

Does anybody else have this problem, and preferably a solution? I'm using MyDOS 4.51 on an Indus GT (I only have one drive).

You are talking about the German game CAVELORD, right ? The game that you
can also find on UMICH ? It's just a copy! CAVELORD is still commercially
distributed :-))) !

BAD NEWS!
=========

For the first time ever, ATARI won't have a booth at CeBIT in Hanover (Germany) this year. Since CeBIT is one of the most important technology fairs worldwide this should make you think! Personally, I hoped they would present their new highlight - the JAGUAR - but it wasn't meant to be :(! What's going on ? Is ATARI no longer interested in their most important market ???

Well it (BBSB) was a pretty nice package with a large color poster etc,
actually BBSB plays better than miner, IMHO
can't believe that it was a limited production run, excellent game!
(I do have the cart and wish to keep it)

From: dwh@delphi.com
Message-ID: <5KwoGW2.dwh@delphi.com>
Source record: 103128

Hi Mike! I *was* using Syn-File until I ran into a problem with
my double-density XF551s. When the database got large enough to expand
to a 2nd disk, the index became corrupted and the program would not
expand to the 2nd disks. I was
forced to delete & then rebuild the index in order to get the data
off the disks and onto a text file so I could transfer to another system.
Is there *any* fix for this? Am I just stuck? I *really* like Syn-File, but
this limitation has
caused me to abandon its' use.

It should be possible to double the frequency (not as easy as with a
steady clock, but possible). Maybe after a few more EE classes I'll
know how.

>Converting the Atari's composite signal (even split luma/chroma) to RGB

>demodulate the color components much like your home television or composite
>monitor does. Chips exist to do this, but since you're doing what already
>goes on inside a composite monitor, don't expect any increase in quality

Are there any RGB signals buried in there before GTIA? I suppose if
there were someone would have come up with something by now.
Unfortunately, the Atari was designed with composite video output at
the center of everything -- probably its greatest weakness AND
possibly why it had such great graphics for its time; it's easier to
replace the CPU than the video output!

I have a (silly) idea, requiring a modern computer and lots of money:
Get one of those $300 TV input boards for a PC, and use the Atari as
the video input for that. Have the Atari displayed in a its own
window under Windows!
Sorry, back to reality now.

>(i.e. color artifacts in graphics 8, color fringing on boundaries between
>two contrasting colors, etc.). Ideally you'd want to replace your Antic/
>GTIA again to have them fetch and interpret colors as defined in RGB, and
>output them as such. And even then, with this mythical substitute chip set,
>you'll quite likely lose compatibility with a portion of your program
>library, which may depend on quirks in Antic/GTIA operation (like APAC
>mode :^).

Any effort to improve the Atari's video will have not work right with
ALL existing software -- besides incompatibilities, some software uses
the deficiencies of Atari video (such as artifacting) to its
advantage.
I really would like to see a solution that gives great video on modern
monitors, and works with existing software, so only one monitor is
required and special software would not have to be written.

Sorry, slipped out of reality mode again. :-)

(Ulf says 'Cavelord' is still commercially available in Germany.)
That's great news, Ulf. How about telling us where 'Cavelord'
can be purchased. We would like to add that vendor to our vendors
list (a world-wide list) of vendors still supporting the Atari
8-bit. Or, perhaps we already have the vendor in csa8 vendor
list. I'm sure you would know, because you keep up to date on
American vendors where you can purchase American software.

650. 850 and DOS 2.5/3.0

Newsgroup: comp.sys.atari.8bit

From: Mark Crispin <mrc@Tomobiki-Cho.CAC.Washington.EDU>
Message-ID: <MS-C.761793804.1147902781.mrc@Tomobiki-Cho.CAC.Washington.EDU>
Source record: 103131

Is the programming and pinout information on the 850 available anywhere? I recently acquired an 850, but without any documentation. I last saw an 850 manual about 10 years ago, and just about all I remember is that R1: and R2: were somewhat more capable than R3: and R4: ... ;-)

I would prefer an online document, but a photocopy of the manual or a FAX would be OK. Maybe I'll create an online document...

Next, what is the word on DOS 2.5 vs. 3.0? I can see quite clearly that 2.5 is the Politically Correct version, but why? Is it because 2.5 is more like DOS 2 and uses DOS 2's format? Suppose there is absolutely NO need whatsoever to interchange floppies with any other system. What are the technical issues between 2.5 and 3.0?

I have determined the following:
1) DOS 2.5 provides a RAMdisk on the 130XE, and 3.0 apparently does not.
2) DOS 3.0 boots the 850, whereas 3.0 does not. [I seem to remember that you need an AUTORUN.SYS or something -- anywhere I can get this, or possibly construct it (e.g. with a BASIC program)?]

Anybody else have this problem? When I play cartridge games on my XEGS with a cable connecting a 1050, the sound on the TV is reduced to an extremely low volume. Unplug the cable, the volume returns to normal! I tried this with a 1010 as well, but it didn't have the same effect. So it has something to do with the disk drive. Very strange.

I hate to suggest this, BUT -=> since this game is clearly no longer available... and has been for several years to my knowledge... does anyone happen to have a file-copy of it? I know, I know, let's all start flaming: pirating is bad, boo, but 1. it's a game that EVEN for it's time, was virtually impossible to find (we had TWO major Atari outlets in town... never recall seeing it!!) 2. many of the old Atari games sold commercially are officially declared as "PUBLIC DOMAIN", and, 3. no one seems to be able to contact the author (as I've heard nothing of "Big Five Software" since the EARLY 80's!).

I've heard it was a "banked" cart, which is pretty downright simple to dump if you've ever tinkered with Wizard of Wor or... well, others... if you've done it, you know what I'm talking about.

(Personally, I've been dumping a good amount of money trying to buy up ORIGINAL copies of games and documentation - heck, I recently spent about $160 at American Techna-Vision. BUT: some games you just can't seem to find ANYWHERE! RE: Drol, Bounty Bob Strikes Back, Thorn EMI Soccer (4 joystick/player game for the 400/800), etc.)

Mr. Fixit (timuszyn@jupiter.cse.utoledo.edu) wrote:

: Wow... looking for some alternative DOS's in my collection, I stumbled across
:an updated MACH-DOS, 2.1 XL to be exact. I thought the only version I had was
:1.something... nice! Anyone know who wrote it? It's claimed by STACE 1984.
:Where's S.T.? (S.T.Atari.Computer.Enthusiasts)

: I wonder if they ever put together a ramdisk option for the DOS!?! This
:thing runs pretty clean, good screen layout, etc.! And it uses the old 3-digit
:sector format old DOS-based programs (such as AtariWriter) love!!! I've tried
:the 3-poke hack to MY-DOS, but it's caused other problems, as a couple others
:pointed out long ago... shoot... had to try it myself though! I've experimented
:with N-DOS, Dos 2.6, Rana-Dos (known by other names also), TOP-DOS (several
:versions), Gardner Dos, 2.5, 3.0, 4.0, 2.5+, 2.0m, and good old 2.0s... not to
:mention MY-DOS and Sparta which are both incompatible with my poor AtariWriter
:cart. I've just so recently bought via mail. I'm sure I've missed a couple more
:DOS's as well, but in short, nothing's covering my needs.

: Has anyone used Turbo-DOS, just recently brought up in discussion in the
:newsgroup? How about Superdos? Both are from overseas I believe. Superdos
:was marketed by a California company a couple years back though. Both have
:[1] ramdisk support and [2] atari dos 2.0 TRUE compatibility (or so I'm led to
:believe). Any other decent RAM-DISK using DOS someone out there in net-land
:can think of??? Please, I'm looking for something to use for all my future
:disk I/O formats and storage!

: (And yes, I'm keeping an open mind to SpartaDos-X... I may just get it for
:general disk use and be "trapped with" dos 2.6 for AtariWriter. BUT, if I can
:find a good general-purpose DOS with RAMDISK (256k, 128k, XE/RAMBO and AXLON
:usage) capabilities and DOS-2.0 compatibility... well, HERE I COME!)
:-BTW: For those interested, DOS 2.6 is the BEST single-density DOS I've come
:across with full 2.0 compatibility. Anyone know if a double-density mod or
:new version ever came out? (hex conversions, sector quality checks, rpm tests,
:sector copying of SPECIFIED sectors only, etc. ALREADY! ... NICE!)

: What DOS's do some of you have/use? Good points? Bad points? Available
:on the umich archive for ftp? Still supported by the author? Are you the
:author? English menu(s)/features?

: -Tim
:

Still open for replies... any hacked DOS's you've created that you'd be
willing to share to the general public (ie: ftp from umich)?

DOES ANYONE HAPPEN TO KNOW WHO WROTE DOS 2.6 OR MACH-DOS??? I'D REALLY LIKE
TO FOLLOW UP ON EITHER OF THESE... IF NO UPDATED VERSIONS HAVE BEEN RELEASED,

I'D BE WILLING TO WORK ON THE SOURCE CODE IF I CAN GET MY HANDS ON IT TO BRING IT UP TO DATE! (ie: enhanced density and extended ram (ramdisk) support)

I was looking through my back issues of New Atari User, and found this mini review of BBSB in the A-Z of Atari software series (New Atari User/ Page 6 don't mind non-profit making organisations reproducing stuff as long as they are credited, so here goes)-

This originally apperared in issue 50 of New Atari User as part of the A-Z of Atari Software set of reviews by Kirk Ruebottom.

(Incedentally the Max is four stars)

BOUNTY BOB STRIKES BACK ****+ (3.5)
platform U.S.Gold 1986(tape,disk) budget

One of the best all round platform games, "Bob" is the sequel to the seminal "Miner 2049er". There are 25 different screens to be jumped through, all brilliantly designed and nicely coloured. The high score and introductoty screens are charming. Old computer magazines are chock full of hints and tips for this game.

I seem to remember a day of two ago, someone requested more info about Gralin International (but i've lost the !@#$% article!)

This is their address:-

GRALIN INTERNATIONAL,
Dept P66,
11 Shillito Road,
Parkstone,
Poole,
Dorset,
BH12 2BN

And if you live outside the UK don't forget top add "England" to the end of all that.

Anyway, they've got lots of stuff, cheap carts (I got 7 for 12 quid), Stereo upgrades, Midimaster II, and much more. If you want a catalogue, send them a self stamped addressed envelope (not very convenient if you live outside the UK since you need UK stamps). They haven't got a telephone number listed however. Hope this helps out some people....

Hello evrybody in this area.!!

A intrudution of myself is a god way to start when you open a new area or a new Net for us Atari ouners here in Gothenburg.!!

I bougt my first Atari -87 and now do I oun 1 ST and 3 130XE. I still work whith my XE sometimes and I think the games is still more funnier on this mashin an on the ST.!!

My next projekt whith my XE is to put up an BBS whith it an try to make some support to the XE ouners here in Sweden.!! And I'm not alone on this project.?? I have an friend up in Stockholm (who knows alot more of the XE rthan I do) who also will put up an 8-bit BBS there in Stockholm.!! The BBS program that he program will be finnished soon but the BBSes will not come up untill august.!! So it will be intresting to see how all this old stuff work as an BBS.!! See you.!!

661. RAMBIT - More 8-bit support.

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-21 14:35:21 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9402211435.AA16469@cs.utexas.edu>
Source record: 103142

This posting is being done as a service by Richard Gore on behalf of RAMBIT.
All replies should be sent to the address given at the end of the posting.

We are pleased to send you details of our PARALLEL PRINTER PORT for the Atari XL/XE computers, connecting to the parallel bus interface (XL) or enhanced cartridge port (XE). The P.P.P. is designed to enable you to connect EPSON compatible printers such as Panasonic KX-P1081, OKI-82, MP-165 etc. and print at their designed speeds, ie not slowed to serial speed.
The P.P.P consists of a compact unit which plugs directly into your computer port and outputs through a standard female 36way centronics socket connected to the printer using the lead supplied with the printer (possibly!).

The software necessary to drive the unit is best incorporated into your OS on EPROM so accessed by normal legal IO calls. Your system is so adapted as to allow use of your utilities (provided they only make stnadard use of the OS, 99% do) whether cartridge, disk or tape without any alteration of them.

TECHNICAL CONSIDERATIONS.

Power for the unit can be taken from the printer on pin 18 of the connector, or from the computer as desired. Should your printer be non-standard parallel, quite possibly we can advise on tailoring to its specification!

Alteration of your cable, ir change of plug or reposition of individual wires, willonly be necessary if it has no male 36way centronics plug on its computer end and/or full 36 wires present.

SUMMARY OF REQUIREMENTS.

PRINTER:- does it output +5volt on pin 18 to the cable? If not check pin 47 of your XL pbi, wiring of this may be necessary.
:-printer signals as follows, SELECT and BUSY both active high, ACKNOWLEDGE and STROBE active low; differences will require tailoring at no extra cost!
CABLE:-fitted with male standard 36way parallel (centronics) plug at computer end.
COMPUTER:- for supply of EPROM driver details of your existing OS will be required and may involve fitting of a DIL socket to hold it. Kit also lends itself to being fitted inside your computer or having printer lead soldered too it.

Prices all inclusive, Overseas +10%. Sterling only, cheques or postal orders made payable to Rambit.

KIT WITH EPROM for XL or XE ....#20

prices for ready assembled by negotiation.

We aim to satisfy and consequently will do our best to give technical support, answer genuine queries and will be pleased to accept your comments. We will also update/re-record on receipt of out original disk/tape with return postage.

Address: RAMBIT, 16 THE GREEN, THURLBY, BOURNE, LINCS., PE10 OHB, ENGLAND

telephone (in UK): 0778 424450

Additional comments by Richard GORE:
Dave Richardson the man behind Rambit is very technical and I'm sure he won't mind me saying has difficulty in writing using non-technical jargon. The above posting sounds pretty complex but what he is saying is he has available a printer interface that plugs into a PBI on the XL or XE and can be tailored for non-standard printers.
I also know he has experimented with using these kits to get two computers interconnected and I think has created an RS 232 interface.

If you are at all interested in such projects I suggest you write to him at the address given above to find out more.

662. HELP NUBY

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-21 15:05:47 UTC
From: kbrennan@magnus.acs.ohio-state.edu
Message-ID: <2kaikb$6g4@charm.magnus.acs.ohio-state.edu>
Source record: 103143

Hey, Hey, Hey,
Help me out if you would (anyone)! I am the recent new (and proud) owner of a good atari system. I have a 130xe...1050 drive...1027 printer...and an indus gt drive...
My problem is that the printer is pretty lousy, ink rollers are hard to get, expensive, and don't work well enough for the trouble. I am very interested in getting a new printer, possibly an epson or another off brand (something that could do graphics). However,(this is where you come in) I don't know which ones are good (with easily found ribbons) or what kind of interface I will need. Please help out. e-mail me (kbrennan@magnus.acs.ohio-state.edu)

thanx
Kevin Brennan

>DOS 2 and uses DOS 2's format? Suppose there is absolutely NO need whatsoever
>to interchange floppies with any other system. What are the technical issues
>between 2.5 and 3.0?

I think one of the disadvantages of DOS 3.0 is that its smallest units of
disk storage are huge 1K blocks, instead of DOS 2's smaller sectors.--

> density disk.

Hehehe, MyDOS uses a special format for ED-Disks, so you couldn't
succeed! One solution would be to copy the files to single
density disks with DOS 2.5 and then copy the files form SD to DD with
MyDOS. Or use a DOS which can handle both densities!

Bye,
Jochen

Well, the one for the Atari was a bank select cart, which makes it quite hard
to make a disk copy of it.. Besides, I'd rather buy the cart than have a disk
copy of it.. Carts load faster.. :-)

669. ATR8000 help

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-21 19:22:51 UTC
From: curtis@darkwing.East.Sun.COM
Message-ID: <2kb1mb$7m8@dr-pepper.East.Sun.COM>
Source record: 103150

Well, time to "beg" again....

A while back, I posted looking for information on how to low level format a HD connected to an ATR8000 with a Z-tec adapter (plugs in between the Z80 CPU and socket, and has a 50 pin (I assume SASI) connector coming out of the back of the ATR8000 to a Xebec ?-MFM bridge controller).

Well, I had no luck.... and gave up on it.... but something clicked and my head and said "try posting again.... maybe ...." (and the voice faded)....

Well, here I am posting again... I'd appreciate any information... pointers to people who would know, might now, might know someone who knows.... etc....

I played with it to wits end, and hate to think I'll never get it working, but that is what it is coming down to.....

Any info.... any at all.... will be more than greatly appreciated,

Thanks,

Keith,

Glad to see that America OnLine has their internet gateway up and working.
I am an AOL subscriber also and have been reading Steve Case's mail about
the coming netnews gateway. I didn't realize that it was working now.
It is much easier (and cheaper) to use our work UNIX machines for netnews
but I may need to use AOL one of these days.

Glad to see you around and hope to hear from you some as you have time.

UP>Hanover (Germany) this year. Since CeBIT is one of the most important
UP>technology fairs worldwide this should make you think! Personally, I
UP>hoped they would present their new highlight - the JAGUAR - but it
UP>wasn't meant to be :(! What's going on ? Is ATARI no longer
UP>interested in their most important market ???

What do you think should Atari show at CeBIT? It isn't the right place to introduce a game-machine. Atari has to present the Jaguar on shows like CES in Chicago or Las Vegas. BTW some other Soft- and Harware companies are not present on CeBIT too, for example Borland.
I think Atari will be back at CeBIT next year, when the new Falcon is ready.

Tschau,

/Martin/

e >ondering if it was circulating still....

I'd seen the file somewhere several month ago... The one thing I do recall
from it was you needed to get the upgrade ROM from ICD (now from FTe) in
order to finish the project. Having looked into both a 1meg and 256 version,
I don't think I'd want to take on that project...it looks to be 10 tons of
work. Oh yeah, you'll also need to find a supply of ZIP rams, kinda hard to
find unless you have some old video boards laying around.

I'm hoping that the new MIO's if any, will have SIMM sockets and allow us
to add as much ram as we want! Think about it, a 64Meg MIO...Yeah, dreams!

If I see the file again, I'll send it to the archives

Well, the best I've been able to find out from someone that had and sold
an ATR with a hard drive connection is, there is a piece of software
called HDFMTR (he believes) that formats the hard drive into 16meg MyDos
partitions. I was also told that you need to conf your hd controler as
d1: and your remaining drive as 2-4. A floppy set as D1: will cause the
ATR not to see the HD...

Wish I could be more help, I have an ATR but do not have the hd controler kit
sold by SWP...

G >flickerterm80 experiment which uses 2 page flipped gr.0 character sets is not
G >panning out with enough cycles to get better than 4800 baud without dropping
G >characters. Yet another reason for a hardware 80 solution.

it's interesting to note that until Clay added the cursor support, FT80 could
handle 4800 with almost no char. drop. And on a pro board where the screen
is cleared between each message, I've had no drop outs. Now, with the cursor
you lose characters starting about line 12 or 13...

It is a bit odd to look at, at first, but ya get used to it. I just hope
he keeps working on the project.

Hi! I'm the proud owner of a very used Atari 800XL. (Used to own one years ago but it got trashed; just found another -- yes I know just how out of date it is; I'm using a Macintosh Centris 610 now, but this is great for memories!) Anyway, I'm looking for:

1) a power supply
2) a space-bar (mine got pried off somewhere along the line)
3) a Pac Man cart (cheap)

Thanks! And if you have a very cheap cart I might consider it. Also, JIC I can't find a power supply does anyone have a diagram showing how to build one? Thanks! (PS reasonable offers only please, I can't afford to spend too much on an Atari!)

I haven't made any comments into the piracy wars yet, but here's one that I feel is important. I keep seeing comments like, "The company isn't in business any longer." That's irrelevant. None of these older games are generating any revenue for the original companies, but they are providing revenue to the couple of dealers still selling 8 bit stocks. They're the ones that need the support, just so they can continue to offer the programs for sale.

>What are the qualifications to make BEQ branch? I know that if I ADC or
>SBC the accumulator and it's zero, it will branch, but what if I DEX the
>X register to 0? What if I LDX a memory location with zero in it?

All of the above, and most other instructions too. Basically, any
operation that causes a change to a register's contents, either a, x, or y,
will set the Z flag based on the operation.

One exception is ADC and SBC while in decimal mode. (See below) The Z
flag is not set accurately based on the decimal operation, but is instead
set based on what the operation would have been had it been binary.

>Third: What exactly does the decimal mode do? (the SED and CLD commands)

When decimal mode is on, with SED, the ADC and SBC operations are performed
in BCD arithmetic. INC and DEC are not affected. BCD means each byte
contains two nybbles, for two digits of a decimal number. The number 12 is
$12 in BCD, versus $0C in binary.

:
: I think it is quite possible that the 65802 could expand our horizons.
: I also think the stereo mod may become more popular if that audio effect
: program actually gets written I've heard about, where you can add effects
: to guitars or other sounds.. Sounds awesome!
:

The biggest thing that turns me on about the 65802/65816 is the new
program counter relative opcodes, which makes things REALLY truly
relocatable, and of course the new 16 bit registers. It not a 65816,
then at least a 65802.. so that we can have these. Really putting the
65816's 24 bit address bus to use is impossible without bringing out some
sort of 24 bit version of the PBI port, or putting your who darn
motherboard in a PC case, and build a daughter board with
slots.

Here's a question:
The MIO is a SCSI host adapter device. SCSI host adapters
can theoretically hook up any SCSI controller. Apparently
it can't be done, what I would like to do. I want to hook up
a SCSI controller for SCSI floppy and use a SCSI floppy with
my MIO. Can this be done? I think I can hook up a SCSI
hard drive with an imbedded controller. The only limitation
I am aware of is the HD must use 512 byte sectors. If FTe
reads this, how about some info on this subject.
About FTe. I understand CSS and FTe are going to try to
co-operate. In essence, the MIO and Black Box are competing
devices, each having its particular advantage. In
particular, the MIO has ram-disks and the Black Box has a
floppy adapter. Any info about this would be appreciated.

Odd... figured you'd have a listing of some of the titles if anyone did. Well, last I remember, a small list was posted about two months ago - would anyone care to repost? I don't have copies of all the articles posted here, although I'm sure some of the mag editors and Freenet Atari 8-bit Admins. could help you out... in fact, check with AC editor... ummm... Jewison I believe his name is (right?). They've been keeping track of existing Atari user's groups and all that stuff, I'm sure he'd have a few titles to rattle off for you!

I'll do some digging myself and see if I can find anything about the old post and followups... keep your fingers crossed!

No, I don't. And I don't know of any. None of the software producers I have contacted have released any of their 8-bit Atari products in the public domain, including Atari Corp. And software doesn't just become PD by itself.

What the heck do you mean by "officially declared as "PUBLIC DOMAIN?"

>believe his name is (right?).
>

Wrong.

I mean, Jewison is my name but I'm not keeping any list nor am I an editor
(just a lowly columnist :-).

This came up several months ago, and I remember someone posted that either
Analog or Antic (or maybe both?) had officially declared on one of the
pay-for-play services that any software which had appeared in any issue of the
magazine was now PD.

I also seem to recall that someone posted something to the effect that one of
the fairly major players had declared their Commie or Apple titles to be PD, but
there was some question as to whether this applied to Atari stuff as well.

Since the Digest has gone into limbo (something which several of us are trying
to rectify) I don't have access to these old posts. Perhaps someone whose
memory is better than mine (or who saved those posts) can fill in the gaps.

As several people have said - apart from that I can't think of any other
software which has been officially declared PD.

Not "everyone" said that Keith "sold out". Some of us stated that he just "moved on" (8-[).

Still, I for one appreciate all of the hard work that he put into making telecommunications on the 8-bit the joy that it has been.

Keith got me so wound up that when I got my first copy of BBS Express PRO (after running BBS Epress for about a year), I sent him the wrong money order for the software!! Sent the money order for my phone bill to him, and the money order for the PRO software to the phone company!! He was GREAT in helping me get things straightened out.

You know Keith, I still have thatoriginal software that you sent me, including Hardback and Restore, both which I _STILL_ use after all of these years!!

>my MIO.

Technically, standard floppy drives are not SCSI devices. They
usually use the 34-pin Shugart interface, which several people have
recently posted pin assignments for. Now if you're talking about
a floptical drive, I believe those generally come with some sort
of SCSI port - whether it would work with an MIO or BB I don't know.
Michael Hohman (FTE) or Bob Puff (CSS) would likely be able to tell
you if it will work.

>Can this be done? I think I can hook up a SCSI
>hard drive with an imbedded controller.

Actually, if I remember from my old (and still beloved) ICD catalog,
I believe it says that use of imbedded controllers in *NOT*
recommended for the MIO. The BB has no such restriction.

> The only limitation
>I am aware of is the HD must use 512 byte sectors.

I'm a little fuzzy on this, but I don't think the MIO can
handle drives with 512 byte sectors. (I don't own an MIO
so I'm not positive on this.) The BB avoids this problem by
breaking a 512-byte sector into 2 256-byte sectors. I think the
general rule of thumb is: Any 256-byte sector HD will work with the
MIO and BB. 512-byte sectors HDs will only work with the BB.

I'm sure someone will gently correct me if I'm mistaken. :-)

> About FTe. I understand CSS and FTe are going to try to

>devices, each having its particular advantage. In
>particular, the MIO has ram-disks and the Black Box has a
>floppy adapter. Any info about this would be appreciated.

If my above information about the MIO and sector sizes is correct,
then the MIO is at a distinct disadvantage when it comes to hard
drives. It's very difficult to find any new drive built with
256-byte sectors anymore. The peripheral market is driven by
IBM-clones and they use 512-byte sectors almost exclusively.

This would undoubtedly require some engineering changes to the MIO, and it's not clear to me that the market exists for two competing SCSI host adapters and that any money FTE sinks into redesigning the MIO wouldn't be recouped by sales.

If FTE decides to redesign and remarket the MIO, more power to them. I don't think it's a good business move on their part, but that's their decision to make. I suspect there's a much larger market out there for things like the OSS and ICD carts. Plus any changes to, say, SDX only require firmware/software modifications, not hardware mods as would probably be necessary with the MIO.

All this, needless to say, IMHO.

> What about MYDOS? It is an interesting piece of work. DO you have any
> benchmarks? How long does it take to format, load Bobterm, etc..?

I don't really have benchmarks, but I can say that a 1050+Speedy/Happy
is a little bit faster, because the HDI hasn't a track cache (it would
have enough RAM, but the cache hasn't been programmed - yet!). A small
speed index:

normal 1050: 19200 Baud
enhanced 1050: 38400 Baud
enhanced 1050 + High-Speed SIO: 76000 Baud
1050 + Speedy + HSS-Copy: 92000 Baud :-)

SpartaDOS can format it with 1.44MB, MyDOS only up to 720K - you can
either format a disk with SpartaDOS and use it with MyDOS, or you can
use a small formatting program!

To format it takes longer than a 1050, of course (I didn't measured this).

Hi Folks!

Finally I got an answer from 'Atreju': if you want the schematics for
the HDI you should ask Jim Harris (has anyone his address?).
Atreju paid 30DM (that would be $20) for the shipping and Jim answered
with a nice "Thanks for the docs", so he doesn't like the idea of
sending the docs again to the US...

Before you write Jim Harris, you should make sure that you are able to
get a 65C32 which can run at 4 MHz! Because this chip isn't available
any more in Germany, Atreju isn't able to build the HDI!

Umm... Isn't there a time limit on copyrights? I *think* there is, and if so, software DOES become PD by itself ;)

What the heck do you mean by "officially declared as "PUBLIC DOMAIN?"

Someone saying "This software is forthwith placed in the Public Domain by myself, the former copyright holder"? :)

>Well, last I remember, a small list was posted about two months
>ago - would anyone care to repost? I don't have copies of all the
>articles posted here, although I'm sure some of the mag editors
>and Freenet Atari 8-bit Admins.

Good idea, I'll check with the Freenet Atari 8-bit Admins. Oops, that's me.

You haven't answered the question. Name one title that was formerly copyrighted but is now PD.

Pretty much anything Antic and Analog ever published as type-ins, no? I seem to have heard rumours to that effect, anyway. Also, I hear the Apple][crowd have managed to get some software placed in the public domain (assuming you meant any old software, not just Atari software).

>characters. Yet another reason for a hardware 80 solution.

He finished FlickerTerm and didn't post anything? aww...

Actually if drawing text is fast enough, but scrolling isn't, I figure, why
even scroll the whole screen? Just use display lists every 8 rows, and when
the screen has to be scrolled, clear ONE line and change each display variable.
Easy easy easy. Would work even better with FlickerTerm, but with somewhat
more work (you'd have to change 24 for each gr0 screen, total 48. Not much
though, it'd take less time than a gr0 blit)

Or, has this been tried?

: >could help you out... in fact, check with AC editor... ummm... Jewison I
: >believe his name is (right?).

: Wrong.
: (just a lowly columnist :-).

Ok, ok... I knew you held some power at AC though... I admit I was wrong here, but I appreciate your followup!

: This came up several months ago, and I remember someone posted that either
: Analog or Antic (or maybe both?) had officially declared on one of the
: pay-for-play services that any software which had appeared in any issue of the
: magazine was now PD.

That WAS part of it, you're definitely right. In fact, a couple of the old titles they SOLD in their "The Catalog" were declared "free" also... let me check an issue here... nope, nothing I recognize off-hand. Chameleon might have been, but I have no definitive proof for the "Mike Current" type.

: I also seem to recall that someone posted something to the effect that one of
: the fairly major players had declared their Commie or Apple titles to be PD, but
: there was some question as to whether this applied to Atari stuff as well.

I remembered something to this effect, but could not recall the titles, so I didn't list any... M.C. needs to know, NOW, for some odd reason tho. If he has some beef with me, PLEASE just email me and don't take it out on this poor 'ole Atari newsgroup. I only posted a followup using info I HAD ALREADY seen used in this group. If it was a rumor I had heard elsewhere, I would've mentioned a different source if not an issue number or press date.

: Since the Digest has gone into limbo (something which several of us are trying
: to rectify) I don't have access to these old posts. Perhaps someone whose
: memory is better than mine (or who saved those posts) can fill in the gaps.

: As several people have said - apart from that I can't think of any other
: software which has been officially declared PD.

I again appreciate the followup! This is basically all I remember (actually, I forgot about the A.N.A.L.O.G. and Antic stuff)... if someone has the company name, I'd be happy to try to contact them myself and find out exactly what titles (if they are including the Atari ports) were made P.D.

: With a small difference on my side: I won't buy anything else from ATARi again
: after that step!

I, also, think their current computer line is on shaky ground... BUT: I am looking forward to the official release of the Jaguar! I haven't purchased a new "game-only" machine in ages, and for the past 6-7 weeks I've been eyeing a couple used full-fledged COIN-OP video games for home use/fun. Some of the mid eighties "arcade" video games can be found in working order, minimal screen burn in, minimal cabinet degradation for approximately U.S.$120!
Now, I'm hearing talk of Atari and other software manufacturers taking the initiative to re-create some of the old arcade favorites of the early 80's on the Jaguar!!! (Tempest 2000, Sinistar (not confirmed), etc.)

(I happen to live within 2 hours of two VERY handy video game auction sites in Michigan, USA... the newer stuff may set you back $400-$1000, sure, but the old Pac-Man, Asteroids, Bump 'N' Jump type stand-up games don't pull in the money for the big arcades anymore and thus sell cheaply!)

:
: I'd seen the file somewhere several month ago... The one thing I do recall
: from it was you needed to get the upgrade ROM from ICD (now from FTe) in
: order to finish the project. Having looked into both a 1meg and 256 version,
: I don't think I'd want to take on that project...it looks to be 10 tons of
: work. Oh yeah, you'll also need to find a supply of ZIP rams, kinda hard to
: find unless you have some old video boards laying around.
:
Back in my bad old days when I lived near the Twin Cities and was active in the
Atari 8bit world, I owned an one meg MIO - very sweet!

An acquaintance of mine owned a 256K MIO which he took upon himself to upgrade
to a one meg MIO.

Yes, this project required a copy of the one meg MIO from ICD to meet copyright
requirements. Even with that, ICD was not happy that he published the plans
in the user group newsletter. From ICD's standpoint, they felt many people
would have too ready access to a PROM burner if they were technically qualified
to do the project.

While ICD may no longer be worrying about possible copyright infringements,
the upgrade was decidedly not a project for the technically feable.

Hung out at Fine Tooned Engineering yesterday. Thought
somebody may like an update. It's somewhat subjective since
I have a tendancy to remember the things I wanted to hear &
ignore what I don't <g>.
Mike has SDX @ version 4.21 ready to go. He's allready put
some stuff into the pipeline like PR connections to B&C
Computervisions (he seems to have a good inventory of PR:s).
He "guesstimated" what he would charge for people who wanted
to upgrade from 4.19 & 4.20 & said he would probably just
send out ROMs to people who wanted to pull the carts apart
themselves. I won't repeat the guesstimate since I thought
it was probably to low to cover the cost of the ROM &
shipping. He's wading through the code for making SDX carts
right now and weighing possible additions. Allmost of it is
in C or cross assembled on an IBM so it's a little tedious to
move forward. I wouldn't expect a SDX, beyond 4.21, with
extra features come out for a while anyway. He also seemed to
have a lot of Rtime carts. I was a little confused since
most talk I've heard on the subject of Rtime batteries =>
soldered. These were all inserted battery types.
I got to see a couple of 80 column boards. The funny thing
is Mike was less then satisfied with the performance (most
people would kill for the existing stuff). We got into a
talk about the merits and methods of doing different mods to
the system. I think the concensious was allowing direct
writing to the video ram would be the way to go, but it's
going to take some serious hardware hacks over the existing
schemes. IMHO: *IF* achieved, 14.4k in 80 columns would be
trivial. The best news is the access Mike has to LSI PLA
design software & equipment. Some of these things are CMOS
with the equivalent of something like 50,000 gates. The
"plan" seems to call for replacing all the descrete logic &
PLA's on the MIO with a single low power chip. Ditto for
anything else that comes out of FTE. If nobody has noticed,
this is the same technique that people like Chips &
Technology have used to help drop the price of IBM type
motherboards to $60-$70! Mike cited a number of figures
about relative manufacturing cost to make me a believer.
I also gave him a printout of most of the ICD/FTE traffic on
the net & he REALLY enjoyed reading it.

Well, thinking back a bit, I seem to recall (but can not verify) the
following statements: 1.) The "DEEP BLUE C" package was given to a user
group (A.C.E.) and later entered into the public domain as "ACE C" and
"CC 8". 2.) A.N.A.L.O.G. magazine, as an advertising ploy, allowed total
circulation of its programs on BBSes in an attempt to increase its
number of subscribers. When the magazine folded, it supposedly released
all of its programs into the public domain. 3.) The "DRAPER PASCAL"
language is in the public domain, but the manual is offered for sale as a
copyrighted work. 4.) COMPUTE! magazine placed its program materials on
the GENIE online service. When asked where this material could be
circulated, GENIE replied that they did not own the rights to the
COMPUTE! ATARI 6502 8-bit material, and the programs could be circulated
anywhere. It is argued that by openly placing the ATARI 6502 8-bit
material on an online service for dispersal without a contractual
arrangement that COMPUTE! magazine has effectively placed their material
concerning the ATARI 6502 8-bit into the public domain. There remains the
question of whether material included both in COMPUTE! magazine and the
division of COMPUTE! BOOKS still retains its exclusive copyright under the

COMPUTE! BOOKS copyright if the two programs are identical. (I do not know, for example, if the COMPUTE! SPEEDSCRIPT in COMPUTE! BOOKS is identical to the version of SPEEDSCRIPT in COMPUTE! magazine, and whether the COMPUTE! BOOKS copyright is in effect, or whether Charles Brannon -- should he be located -- has the power as the author to place his work into the public domain.) 5.) The "FIG-FORTH" language from the FORTH Interest Group --IS-- in the public domain. Unfortunately it runs only under SPARTA-DOS (which is --NOT-- in the public domain). 6.) The F.O.R.E.M.-XE BBS is in the public domain. Unfortunately it needs a BASIC-XL/XE cartridge to run and these are --NOT-- in the public domain. 7.) The AT-KEEP citadel-style BBS program is in the public domain. Unfortunately, it too needs a BASIC-XL/XE cartridge to run. 8.) ACE A.M.I.S. BBS is in the public domain. 9.) The F.O.R.E.M. RBBS-style BBS is in the public domain. 10.) The BBS Express BBS is in the public domain. 11.) OASIS JUNIOR III BBS is in the public domain. NOTE: AT-KEEP, A.M.I.S., F.O.R.E.M., The BBS Express, and Oasis Junior III, are all non-networking versions of BBSes. Some software company supposedly placed their entire ATARI 6502 8-bit catalog into the public domain, but I can't remember the company name at the moment. 12.) The source code to TEXTPRO version 5.0x (experimental) was released to the public domain. 13.) The source code to KERMIT-65 is in the public domain as part of the Columbia University KERMIT group. (?) 14.) The ATARI 800 OS is essentially in the public domain as it was openly distributed free of charge as the "Translator" disk.

As for ANTIC, the thinking goes something like this... ANTIC walked off, breaking the contracts they had signed with several authors whose work they had already published and breaking at least half of their subscriptions. ANTIC, in order to sue anyone for distributing their copyrighted software, would have to appear in court as a corporate entity. As soon as a representative of the ANTIC corporate entity appears in a court of law, such a representative may be held actionable for ANTIC Publishing's breach of contractual obligations. Thus, ANTIC Publishing, merely by setting foot in a court of law, would take a huge financial hit merely for existing once again, even before it contested any copyright. Essentially, ANTIC has no effective say in what happens to their software as they seem to have refused to honor their contracts. Someone commented that in such a case the copyright would not move into the Public Domain, but rather, revert back to the individual authors (unless it can be shown that ANTIC Publishing openly distributed its software collection to the public while its contracts were still enforcable, i.e. they bought the programs and then gave the programs away while the programs were still under contract to them). The above was the opinion of an author of one of the ANTIC programs who had sought the advice of legal counsel on how to go about collecting payment for his program. (His name escapes me now.)

Anyone who knows the specifics to any of these situations... please feel free to add any information, as all I know is the "gossip" that has been tossed about, rather than any of the facts.

>fine on my 400 though.

I had an odd experience with Synapse's Blue Max (tape) game way back in
time. It kept telling me to "remove cartridge" when the first (three records
or so) part was loaded. I took a look at the loader code and noticed that it
used address $0007 to determine if a cartridge is present. It was possible
to load the game if I typed POKE 7,255, left BASIC with BYE, and pressed
reset (and start and option).

>Also, there's supposed to be Missile Command built into this machine, right?
>Can someone please tell me how to start it? I don't have an owner's manual.

What happens if you simply switch on the machine without pressing any
button at all?

I replaced the BASIC ROM chip in my 600XL computer with a ROM from the
Missile Command chip one. Worked fine, but will probably not be of much
help here.

>ICD stuff, but both would be co-operating. I've heard FTe
>doing Action! work, in particular. Didn't CSS buy the
>OSS stuff?

Nope. FTE bought the rights to *ALL* ICD stuff. The confusion with CSS appears to be coming from the newletter that CSS sent out in December where they stated they would be selling some OSS carts and the R-Time8. Most people seem to have assumed that meant that CSS bought out the OSS carts. What it really means is that CSS will be selling the OSS carts supplied by FTE who bought the rights from ICD.

Damn, I've been hangin' around these NASA people far too long. I just generated a sentence with no less that 4 TLA's in it. (TLA = Three Letter Acronym).

>However, if they don't plan on importing the games, then that won't stop me
>from getting them, as it didn't stop people from picking up Draconus and
>Zybex as if they were public domain.
yup! and now Zeppelin no longer does Atari 8-bit games.

Just about all the distributors in Europe are quite happy to send things
abroad. Sure it costs a little more, and you've got the problem of sending
the money, etc... but it isn't an impossible task. Just take a look at
this newsgroup's Developers list. Lots of names in there!

These games still can be bough legaly, especialy now that Micro Discount
has anounced it is going to re-release the Zepellin range.

There is no need to stoop to piracy if these games are still sold! Just
because they aren't imported into the U.S.A. does not mean you can't buy a
copy from abroad.

727. December AC: To Glenn Saunders

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-23 19:34:37 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9402231912.AA07798@phinet.smithkline.com>
Source record: 102908

Hello Glenn,

First off, the Feb. Ac is late, REAL late, like one full month. It just went "to press" this week & will be another 2-3 weeks before the proofs are corrected & printing & mailing. This winter has just been pure hell for me. There will be a short article in there giving some of the gory details about how the severe weather has affected the magazine.

As to your personal subscription, like everything else I've fallen behind on logging in renewals & stuff but will be catching that up this week. I've made a note to check the status of your sub in the mailing list & will get back to you.

The december AC was mailed out on Dec. 14. However I know of one guy who didn't receive his until the first week of Feb.(!) Go figure...

Subscription labels with a "1093" in the upper right corner whose renewals weren't received by Dec. 5, 1993, missed out on the Dec. issue. If the renewal was received after Dec. 5, your renewal will start with the Feb. issue & you'll have to purchase the Dec. issue separately as a Back Issue.

All back issues (magazine or disk) of AC are now $5.00 each. All items since Dec. 1992 are available except the Feb. '93 issue which is sold out. Cash or check payable to BEN POEHLAND (not Atari Classics!), 179 Sproul Rd. Frazer PA 19355 USA.

Due to a shortfall in subscriptions I was forced to order a cutback in the press run of the Special Video Issue we published in December, which is 4 pages longer than usual due to all the special video hardware articles. That issue is now in short supply.

People with a question about their AC sub should not assume I'm reading the newsgroup (I happened to get this message by chance). Instead, contact me directly at: poehland@sb.com or poehland%phvax.dnet@sb.com.

728. RE: Two MIO Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-23 22:00:09 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9402232137.AA10006@phinet.smithkline.com>
Source record: 102909

Sheesh, this is the 2nd time this week I've seen inquiries about upgrading an MIO.

Yah, it's possible to upgrade the memory. Terrible job, tho. You need two items, neither of which is easy to find or cheap. 1.) a 1-meg ROM for the MIO (the 256K & 1-meg versions have different ROMs). Maybe FTE will sell you one. 2.)256K ZIP DRAMs (24 of them!) This is a weird sideways-mounting 256KDRAM chip. Hard as heck to find. There's a place called Easy-Tech in California that had them a couple years back. Also Active Electronics in Massacusetts or somewhere. They cost like the dickens, like $3.50 apiece. But, getting the ROM & DRAMs is the EASY part.

Next, you gotta de-solder 384 holes on the MIO board. Stick in the DRAMs, then re-solder those same 384 holes. <groan!>. That's 768 operations, if my arithmetic is right. Lordy!

I got an Attitude about the MIO. Mostly because it's obsolete, you'll have a tough time using it with hard drives sold in today's market. Reason is because the MIO formats 256-byte sectors, & most of today's hard drives require 512-byte sectors. The Supra interface has the same problem. To my knowledge only the CSS Black Box formats 512-byte sectors.\

As to availability of the adaptec 4000 series cards, I understand CSS sells them. Price around $89 as I recall. Dunno if they still gottum. The CSS price is the lowest I've seen, I wish I'd bought mine there. I got 2 Adaptec 4000A's from some surplus place in California & they soaked me $120 for them.

One good thing is that the Adaptec company is still in business & still supports their products. I called up Adaptec & requested manuals for the 4000 series & they sent 'em to me. Free as I recall. Nice.

This is for Rob Funk: I agree with Jeff Potter's assessment of the difficulties you'll encounter trying to speed up the 6502 clock. This subject seems to come up in this forum about once every 2-3 months & has been hashed to death. BOTTOM LINE: all discussion of speeding up the clock are a waste of time. I'd rather see folks tackling something that really IS do-able.

Yes, there are digital signals available in both the XL machines & the XEP80 that you can tap into to make a TTL interface for your 8-bit. But, it's minimal (read: MDA only, no color). The hack was published by Bob Woolley in the December '93 issue of Atari Classics.

I once examined the prospect of taking the composite output & converting it into true CGA. I know for a fact that be done. I bought all the chips, then never got around to it. The advantage of doing it that way is it would just be an add-on external box rather than a messy under-the-hood hack & would give color.

Assuming, of course, that anyone could STAND using a CGA-quality wordprocessor. Ugh! MDA is much better for text things like wordprocessing, databases & telecom stuff.

Just my $.02.

This is for Kevin Brennan: Unless you got money to burn or are really desperate to do graphics I'd like to suggest you hold onto the 1027 for awhile. Replacement inkrollers are available from B&C, & their latest stock doesn't disintegrate the way the old ones did. If you got this stuff used no doubt the little bottle of oil is missing, that's the first people lose (or throw away).

The inkroller on the 1027 can be snapped out & rejuvenated with black numbering machine ink (avoid stamp pad ink). The 1027 will work fine, producing nice letter-quality text, if you treat it right. (No one EVER treated them right, & the crappy manual that came with it was almost useless.) Lubrication is the key. Use Lube Gel from Radio Shack & apply a thin coat of it to the 4 bars in the 1027: 2 bars that support the inkroller head, & 2 more bar up behind that support the striker head. If the bars are dirty/dry/corroded the head or striker will hang up & then the printer goes completely bonkers.

Sure, the thing is slow & noisy as the devil but takes up very little desk space & puts out true letter-quality print.

I wrote an article about it in Current Notes a few years back... ummm, Feb. 1991??? There was also a reference to the inkrollers in the TnT column of Atari Classics, December 1992.

Some later versions of the AtariWriter ROMcart had a built-in driver for the 1027. REV B? C? something like that....

(Glenn Sanders says CTH BBS has some unzip stuff and that he
is, like, collecting unzip stuff or something.)
I don't claim to know everything Tom Hunt is doing. I understand
CTH BBS will be ending Feb. 29. I did send Tom my unimploding
Action! shell. Thanks for your interest. There are a couple of
people who have contacted me directly and we are making progress,
progress meaning exchanging information. I looked a bit into
the inflater part in the 'C' code. I started thinking about
some assembler code that loads up in $A200 or so. $2000
to $9FFF being needed for a 32k buffer. Now whoever said
something about Mr. Ledbetter, he seems to have disappeared,
just when he was talking about a cross assembler. Now I don't
know what a cross assembler is, but I imagine such a thing
would allow me to code in the $A000 to $BFFF area, which
I bet I can't do with Mac65 or Assem. Ed.

Actually they are copyrighted material, as for distribution they might be limited to COMPUTE subscribers only or they may allow free distribution. The distribution thing is what makes a difference, a commercial game can be expect to be copyrighted and you don't distibute them. Copyrights are complicated and a big pain in the neck.

Someone writes:

> I don't mean to start anything, but all of Computes programs
>are PD, And I know that others have become I don't have a list.
>, but maybe someone does.

Yes, software published in the magazines is sort of a special case. It depends on what agreements were signed between the publisher and the author, but usually these fall under the "works made for hire" section of copyright law. Such software becomes the property of the magazine either when published, or usually when received.

I have also heard that Compute has placed their software into the PD. The former publisher of Analog seems to have done the same. The situation with Antic, on the other hand, seems less clear. They just sort of up and disappeared, without refunding subscriptions or saying anything about the software they own. Many people seem to think Antic's software may as well be PD because they aren't about to resurface to prosecute people, but that ain't the way it works.

I was thinking more along the lines of commercial software that has since been placed into the PD by the former copyright owner, where the owner was a dedicated software publisher. The one such examples I've thought of since yesterday is Draper Pascal.

Gee, while we're at it, why not just design a whole new computer, based on a 65816 or 65C02 or whatever, perhaps with its own OS and software, or perhaps not, but WITH the necessary circuitry in place so that you could pop the custom chips off an old Atari 8-bit motherboard, pop them into sockets on the new computer's motherboard, and run in "original" Atari compatibility mode, "16-bit enhanced" Atari compatibility mode, etc...? Or is that the gist of what's already been said?

Chris

Apparantly a cross assembler can do things like compile 6502 code on
an Intel machine. Stuff like this is available on many Unix platforms,
to write code for IBM, Amiga, and Macintosh remotely.

>would allow me to code in the $A000 to $BFFF area, which
>I bet I can't do with Mac65 or Assem. Ed.

Perhaps you could write the code in $6000, and create a program to
relocate the code to $A000. Another ML program could be made, or
lready exists, that tracks down JMPs, JSRs, and self-modifying code
within such things as LDA and STX, and relocates them to reflect what
it would be if the program were coded and compiled at $A000. Then
the program could be saved starting at $A000.

How about those old games that used to be played on table tops? You could
play two-player games, and when the other player was playing you got to
watch it upside-down. Those were cool. About ten years ago, my friend even
had one in his backyard. It was a monochrome Space Invaders game.

With the ATMAS-II assembler you just compile it as if it is
compiled to $A000 or something, but store the results somewhere
else. Also, isn't is possible to compile directly to disk? If
I remember correctly, I did such things, way back in my MAC65
days...

This is the way I see it, but I would assume if COMPUTE! Publications put the software into a online service like GEnie then it would be not in the public domain but copyrighted with free distribution, more or less Freeware, which is copyrighted software but can be freely distributed and no money is asked for the use. Unless there is something that none of us know about, maybe distribution is meant to be targeted at subscribers, which is ridiculus (sp?).

> domain. 10.) The BBS Express BBS is in the public domain. 11.) OASIS

I heard this, but when Keith Ledbetter posted a message I replyed asking if BBS Express was in the public domain, I haven't heard anything back, but I suspect he is likely to call on weekends since he is probably fairly busy developing software. Unless the message bounced.

I understand that BBS:Express! PRO is owned by someone else now, Keith sold it, and I undestand that BBS:Express! (850, 1030? Was there any others? If 850 is public domain where can I get it, I have the 1030 version and would send it to atari archive if it is in the public domain and if I knew who to send it to), now my question is the source code for BBS:Express! in the public domain or should I expect that the source code evolved into BBS:Express! PRO and it is also the copyrighted work of the new owner.

Thanks for any answers from you and anyone else in advance.

First: What location can I LDA to to find a random number from 0 to 255?

You can try the timer locations, low in page 0 - but they may not count 0-255. You may find it better to make your own random number generator - a simply one is to write a subr that performs:

x(n+1) = a*x(n) + b

where a and b are mutually prime. Implementation of multiply-by-constant is simple in assembly language - it's a bunch of shifts and adds. Your subroutine could return with the new x(n) in A.

Second: About the BEQ/BNE commands.. you know, the zero result ones... What are the qualifications to make BEQ branch? I know that if I ADC or SBC the accumulator and it's zero, it will branch, but what if I DEX the X register to 0? What if I LDX a memory location with zero in it?

BEQ/BNE, like the rest of the branch conditions, test settings of the condition code register. After most operations, a summary is loaded in the condition code register - Z if the result was zero, C if there was a carry-out, N if the result was negative and V if the result overflowed. You'll need to look it up in a 6502 instr. set summary, but DEX etc do set the condition codes. Different instructions different condition codes. For example, LD and ST don't change the carry bit, so you can perform multiprecision arith. on data in memory.

Third: What exactly does the decimal mode do? (the SED and CLD commands)

Decimal mode causes adc and sbc to run in BCD (binary coded decimal) mode. For example, in binary mode 0x17 plus 0x25 makes 0x3C; in decimal mode, 0x17 plus 0x25 makes 0x42.

You should find a 6502 instr set summary. Try a Rockwell component
spec for the 6502 - or rather, paperback book swap stores like Annie's
near me usually has a supply of old computer books that would have it.
It's the same processor as used in Commodore and Apple.

> mashin an on the ST.!!

Yeah I feel that way also, and I think alot of others do. I have a
Commodore 128, a Atari 800XL, and a IBM AT 286, and the games are better
on my C128 and Atari than on my IBM, sure they have awesome sound, and
excellent graphics but there is no fun because the gameplay sucks, they
are too easy, I would play a game without sound and with weak graphics if
it just had a little bit of entertainment value, actually I do.

> My next projekt whith my XE is to put up an BBS whith it an try to make some

> untill august.!! So it will be intresting to see how all this old stuff work
> as an BBS.!! See you.!!

I think it is a noble concept, but I wouldn't do it. My support would
be as a IBM based system because the machine is faster, the equipment is
cheaper, and the software available can allow your system link up with
Fidonet, the largest PC network in the world, and Usenet, probably the
largest (a part of) network in the world. Those service are quite
important and are something to consider when setting up a system. ST
does offer Fidonet, if you find the right software, and probably even
Usenet if you find the right host. There are Usenet hosts that offer
Usenet conferences in Fidonet message style, so you can either get a UUCP
account and dial-up for your Usenet mail or you can get it from a host
that does the same thing. The only thing about it is you would want a
computer to handle mailing only, as I suspect is the same with machine
linked to Usenet on the Internet, I would think that all of that mail is
quite a bit to put on one machine, especially on the IBM PC, since there
is no background mail handlers or dameons (TSRs/device drivers).

Oh well, enough of my babbling, good luck with your BBS.

JD>FTE designs could take advantage of better technology than the old mono-
JD>chrome-TV-without-a-tuner monitors most of us have tried to use for 80
JD>columns on our 8-bits.

I was thinking it might be fun to interface a VGA into a cartridge or
to the parallel port. You'd have 320x240x256 colors (yes there's a
way to set that up), or 640x480x16 colors. That and a cheap VGA
monitor (I got one on sale at Lechmere for $100) gets you there,
although you'd have to write a driver to simulate output to E: and S:.
The things has lots of text modes, too.

Also, when you're not using it, the 256K of memory within would make
a dandy RAMdisk - which might look cool if you leave the monitor on.

>Freeware, which is copyrighted software but can be freely distributed and
>no money is asked for the use.

Right. Software in the public domain may be freely distributed, modified, sold, or otherwise used for benefit without any requirement of credit, notification, or other compensation to the original author. This is very different from freeware, where the author retains copyright ownership, but grants limited permission to distribute the software freely.

It's hard for software to get into the public domain. Basically, either the _copyright holder_ explicitly and unabiguously forfeits all copyright ownership associated with that software, or the copyright expires. As far as expiration goes, as of the Copyright Act of 1976, copyright lasts for at least 50 years beyond the authors death. So nothing having to do with the 8-bit Atari qualifies yet. :)

Who holds the copyright, if any, of software published in Compute? Possibly the original authors, but more likely Compute aquired them as their own, either upon publishing them or upon receiving them. I'm not familiar enough with Compute, software that came from Compute, nor the circumstances of their posting of their software publically to be able to say. But I can tell you that allowing your software to be distributed freely is not enough for it to become part of the public domain.

Amos --

well, I've been pretty busy in the past few years. I've had a good run of shareware products in the IBM PC-compatible arena, which keeps me plenty busy (it's still a "part-time" thing for me in addition to my "real" job .. at least for the time being <g>). One of my utilities was up for the Association of Shareware Professionals "Product of the Year" last year (shameless plug..hehe). I'm also doing lots of Macintosh development at my job; I haven't bothered doing any shareware on the Mac because there just isn't a big enough user base to make it worth it (at least that's what all other Mac shareware authors have told me).

I've been totally out of the Atari for about 4 years now, but I still do try to keep in touch with a lot of the many friends I made throughout those good ol' Atari years. Glad to see you're still out there having fun!

Keith

ps: on the Express Cartridge .. all I can say is that things may be "changing" soon on the availability <g>

Of course, such an algorithm only produces pseudo-random numbers,
repeatable given the same seed. Even the most optimized versions of
these algorithms fail certain tests for randomness.

A few years ago I tried some simple tests of Atari BASIC's RND(0) function,
and was rather surprised when it easily passed every test. Does anyone know
just how AtBASIC's RND(0) works? I read somewhere (Mapping the Atari?) that
instead of an algorithm our 8-bit Atari's read random electrical noise off
of some circuit. Can anyone confirm this?

You'd have to burn a new PROM for the XEGS, too - a friend of mine and
I ripped his open some time ago (and looked in some manual or magazine), and
the GS has one 32KB ROM which contains Missile Command, BASIC, and the OS.

Hi!

In a recent move I seem to have lost the power supply
for my Atari800. There isn't any indication of the power
requirements on the Atari itself, so I'm at a loss about
what sort of replacement to look for. Does anyone know
what the input to the 800 should be? (this might be
printed on the original power supply)

Thanks!

Works by a single author: 50 years after the author's death.
Works with co-authors: 50 years after the death of the last surviving
author.
Works-made-for-hire: 75 years after first publication, or 100 years after
creation, whichever comes first.

I don't think anything having to do with the 8-bit Atari qualifies yet. :)

> What the heck do you mean by "officially declared as "PUBLIC
> DOMAIN?"
>
>Someone saying "This software is forthwith placed in the Public Domain
>by myself, the former copyright holder"? :)

Exactly. Note that this usually requires the _copyright owner_ to
_re_-release the software. This is pretty rare, because copyright holders
have nothing to gain from it.

> You haven't answered the question. Name one title that was
> formerly copyrighted but is now PD.
>
>Pretty much anything Antic and Analog ever published as type-ins, no?

No. Just look at the first few lines of all the programs in Antic (except
for the first year or so). Every program contains the notice "Copyright
(c) 19xx, Antic Publishing.

It is widely believed that the publisher that used to publish Analog
released all Analog software into the PD. I can't confirm this, but I
trust the pay services wouldn't allow them to be uploaded if this wasn't
the case.

I'm sure Antic never released their software into the PD, but people may
have decided that since they took off with all our subscription money, we
should be allowed free access to their software. No sense involved if this
is the case, but that may be the underlying sentiment.

>I seem to have heard rumours to that effect, anyway. Also, I hear the
>Apple][crowd have managed to get some software placed in the public
>domain (assuming you meant any old software, not just Atari software).

Yes, Apple][user groups have worked together and successfully convinced a
few publishers to release the old Apple versions of their programs into the
PD. If our community so desired, we might be able to do the same.

In article <199402242130.PAA34264@blue.weeg.uiowa.edu> mcurrent@blue.weeg.uiowa.edu (Michael Current) writes:

A few years ago I tried some simple tests of Atari BASIC's RND(0) function, and was rather surprised when it easily passed every test. Does anyone know just how AtBASIC's RND(0) works? I read somewhere (Mapping the Atari?) that instead of an algorithm our 8-bit Atari's read random electrical noise off of some circuit. Can anyone confirm this?

It does... Not sure what the register actually DOES, but it's a sound register ($D20A, from the other posts that have appeared in this thread :). Bill Wilkinson did some tests in INSIGHT: Atari (his Compute! column), and found RND(0) wasn't that random... I wouldn't know either way :)

Source record: 102946

I have an ATR-8000 on my 256K 800XL and have had problems
using 5.25" 720K floppies with it. They format okay and seem to
read and write but when they get about half full they are no longer
readable. I am using the CONFIG80 driver that came with the ATR
when I bought it used. I was wondering if it couls have the step
rate set at 3 ms for 3.5" drives instead of the 6ms which the
5.25's need. I'd apprecite hearing from anyone who has used
720K 5.25" drives successfully with the ATR-8000. Also anyone
running a hard disk with the ATR. I have the Z-Tec hard disk
controller for it, but don't know if it supports SCSI or just
SASI and I don't have any software for it.

(Corrections, etc. to previous posts.)
I'm sorry I misquoted B. Poehland. Right he said ink for a
numbering machine(not inkpad inker.) I don't know what a
numbering machine is. Anyway, we agree that don't use
the roller ball type ink pad inker on the 1027 printer
ink roller, use either an oil based, numbering machine,
ink or you can put some wd-40 in a bottle cap or something
and brush it on the roller.
Also I said CTH BBS was going down Feb. 29. There are only
28 days in Feb. this year. CTH is apparently staying alive,
however.

Source record: 102954

>Has anyone else gotten the new release of Jawbreaker yet?
>I love the extra maze. I think I might have found something else
>hidden in the game but I'm not sure yet. Anyone find anything?

<grin> I think this is a tactical way to say you found it, but are not sure if it's supposed to be public knowledge.

Yep there's something else hidden there. For a hint, this entity was discussed here awhile ago, but was previously unattainable due to bad sectors on a physically damaged disk. With a little work, I was able to recover the program, and save this yet-unseen entity for others to enjoy.

John Harris - jharris@cup.portal.com

P.S.

I used the following methods for recovery, which may help others in a similar situation.

I removed the cover of the drive, so that I could apply some extra pressure to the R/W head when reading difficult parts of the disk. Including some light tapping. This recovered a good percentage of the disk, and I copied all of that to another place. I then used a smooth piece of plastic to try and straighten some of the crease damage. I wondered whether using metal for this could have any magnetic damaging effects, so I played it safe and used something non-metallic. While not hugely successful, I think I recovered a few more sectors.

Lastly, still left with a few more bad sectors, I wrote a small utility that continuously read a single sector into a visable portion of the screen memory. Even bad sectors can sometimes read a good chunk of the proper data that was supposed to be there. I monitored the Shift key, so that each time I felt the sector had read something decent, it would log it away in memory. I could log as many copies of the sector this way as I wanted. My original plan was to compare all of these sector copies, and pick out the data that occurred most often. This approach didn't work, as the magic info seemed to be the hardest thing to coax out of the sector reading. I wound up doing mostly manual cut&paste of sector data to restore as much as I could. In most cases, I was able to get all but 10-20 bytes of these sectors reconstructed. While that might not be enough for some applications, I was able to piece things together, from having both partial source code, and partial object code, and S-Record object files that this old Asm/65 assembler created.

It was not an easy process, but I'm really happy I finally got a chance to do it, and got the program back.

Now if I could just have similar success with this BASIC program on
cassette tape. :-(

Yes, indeed, METAL is a comm. programming language for IIe/IIc/GS.
It's written in assembly, and it's meant to take advantage of the built in
serial ports on the IIs. As for porting METAL to other platforms, I'd
love to see it happen, but I doubt it could. The one to talk to about
this is Xevious from The Atomic Playground(Xevious@tap.colum.fnet.org)...

Do you have a memory map? If so, consult it on the contents and use of
$D301 and $D302 (port A and B controller). I forget what bits need to
be set to configure the ports for output but a good memory map should
tell you which ones they are.

Message-ID: <1994Feb27.012855.24979@mnemosyne.cs.du.edu>
Source record: 102861

Michael Current makes a lot of sense on the issue of pirted software/games. But the reality of the lack of availability flys right in the face of that sense. Since I have most of the software that I want right now that is currently available, why should I buy something that I >don't< want in the hopes that it will somehow encourage vendors to get something that I >might< want?

My own thoughts are that there should be some sort of "clearing house" approach to Atari 8-bit software. Vendors should be given the right to sell copies of any software as long as the royalties and such go to the copyright holders of said software. That way, there would be no need for fancy packaging and promotional materials. I know that sounds sort of vague and is probably unworkable in the end, but anything else sounds like pie-in-the-sky to me.

It's not worth it to pay exorbitant fees to get software from European sources either. What would it cost to get Bounty Bob Strikes Back from Poland or England compared to what it would cost to get it if it was available here? (use US dollar equivalents - I'm not exchange-rate literate) And who wants to buy something sight unseen as well? I find it very dificult (personally) to rely on descriptions of software that I've seen presented here on the net in text only. There are no 'screen shots' to help persuade, and if I'm ultimately unsatisfied with the product, then who pays for shipping to return the stuff? [that of course, requires that the foreign vendor have a reliable return policy as well]

I'm sorry, but I have to go along with what was said previously. If the item in question is not being sold anymore and the original company is defunct (nearly 100 percent of the US companies) and nobody on the vendor list carries it, pirating the thing seems to me to be a viable alternative. Every day that goes by, wishing for a miracle just means that miracle is even farther from happening than before. The 8-bits are dead, the infrastructure that supported them is dead, and the number of people that still use the things is pretty close to dead as well. :-)

And so it goes...

ATARI has *always* presented *all* its products at CeBIT, like the LYNX
and VCS. These are indeed game machines! I think you know that ATARI
doesn't hold official ATARI fairs any longer, don't you?! This and the
fact that ATARI won't have a booth at CeBIT should make you think!
>Chicago or Las Vegas. BTW some other Soft- and Harware companies are not
>present on CeBIT too, for example Borland.
Has Borland ever had a booth at CeBIT :) ? Anyways, I don't think that
Borland for instance has had any financial problems like ATARI!
>I think Atari will be back at CeBIT next year, when the new Falcon is ready.
Yeah, right ;))) ! And they'll present their new 8-bit line, too ;)))))) !
C'mon, get real ! A new FALCON will never go into production like so many
other products before.

As for ATARI and the Jaguar, American dealers could tell you some true
stories that you would never believe!

Finally, some facts: ATARI moves its German HQ more often than any other
hardware company. Wholesalers have been reporting ENORMOUS problems with
ATARI's products+supplies and will no longer distribute them. Also, ATARI
is *HARDLY* reachable via Videotex. So, do you still think positive about
ATARI's future ?

783. Re: Old Games

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-27 09:02:32 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <BE9pfsI.lmcclure@delphi.com>
Source record: 102864

I think the basic problem stems from the fact that software is not the same as a book or a piece of music, but the copyright laws essentially treat it the same.

A 50-year old book (or even older) can still be a very entertaining or informative read, and although some music goes out of style, it can also become popular, and if you liked it then, you probably like it now. Books don't require external equipment to use or enjoy. Music typically does (an instrument to play it, or something to listen to it on), but when was the last time a piece of music fell out of publication simply because the instrument or played it on, or more likely, the machine you listened to it on, is no longer manufactured?

The vast majority of software is very machine specific. When demand for the machine it works on dies, so does the demand for the software that runs on it. Music and books "die" only due to unpopularity. When 8-track tape players lost out to cassettes, the music that was still popular went to cassette. The same with LP's vs. CD's. The music did not have to be "reprogrammed" or "ported" as a program is...simply re-recorded.

If every computer could run every piece of software ever written (requiring only 're-recording' when the popular formats changed from punched paper tape to cassettes to 8" and 5.25" floppies to 3.5" floppies), then it would make sense to treat software the same.

Personally, I think the world would be much better off if the copyrights on software where intially 5-10 years, but renewable for approximately the same length of time as current copyright laws allow. Personally, however, I can't think of any type of software that should require 50-75 years of protection. I cannot even imagine a later series of a mainframe running the same code, even if portable, as its predecessor used half a century ago. Still, it would not hurt to allow such renewals. Even a 10 year period of protection, followed by a single renewal for the remainder of the usual term would be a benefit. How many 8-bit software makers have ceased to exist during that time, with whoever inheirited or acquired the rights as part of the company assets either not knowing they had the rights or not caring, within such a period of time?

The problem is, there changes a few years ago to the US copyright laws were primarily to bring it "in sync" with that of many other countries, meaning that one would have to lobby not only for changing US copyright laws, but that of many nations, in order for the US to consider such a change.

Also, I expect many software companies would fight such a change, despite the fact it would have virtually no impact on their bottom line.

From: F Tooned <ftooned@delphi.com>
Message-ID: <BQ2LvkM.ftooned@delphi.com>
Source record: 102867

Just thought I would check in and say that I'm available
to help sort out some of the confusion that has obviously been
generated...
Yes, FTe has all rights to the ICD/OSS stuff...
CSS is simply distributing OSS Carts and the R-Time 8.
Bob Puff has been extremely helpful in the "ICD to FTe"
transition, and has contributed bug fixes for MAC/65
and Action! as well as a program to help set the R-Time 8's.

The MIO will not be remanufacured in it's current form.
Replacement units and repairs for existing devices will be
done though...
There is talk about an 80 column card, although it's not
really a new idea, and is simply happening due to ICD's
initial intentions with it.
FTe does have 80 column prototypes running on the MIO,
and if enough interest is there, it could very well happen!

I would be leary of most rumors, and if you really want the
straight scoop, I encourage everyone to call, write, or
mail me here at FTooned@delphi.com or on Genie at F.Tooned...

I really don't think there is much to worry about as so far
as competition... And if it gets down to it, I'm sure that
CSS and FTe will resolve these issues...
There is too much to be gained still with everyone pulling
their resources!!
Mike

Was the CTH BBS message a joke - or has Tom changed his mind on taking his BBS down?

Tom's one of the 8bit worlds greatest programming assetts.. Hopefully the hardware trouble he's having will be resolved, as I understand that someone donated a hard drive to him.

That's why they call it a random sequence generator, it is predictable.
There is really no way to generate a truely random number that I know of.

I don't have any of my Atari manuals handy, all at a warehouse in
storage, so I couldn't tell you exactly what $D20A, but someone else said
it was a counter, probably used for internal purposes.

(Kamaro Kid asks if CTH staying up is a joke or something.)
No, I talked to Tom yesterday (2/26/94) and he said he has
all his hardware problems fixed except a new power supply.
I talked with him about a week before and told him I respected
his decision to quit the board. He just continued the conversation
like it was going to be done. That's why I posted the original
notice that CTH was going down. The termination of a 10 year
BBS is a complex decision and I don't know what Tom is going
to do. Right now, it seems the board is going to stay up.

UP>For the first time ever, ATARI won't have a booth at CeBIT in Hanover
UP>(Germany) this year. Since CeBIT is one of the most important technology
UP>fairs worldwide this should make you think! Personally, I hoped they would
UP>present their new highlight - the JAGUAR - but it wasn't meant to be :(!
UP>What's going on ? Is ATARI no longer interested in their most important
UP>market ???

I'll tell you, the weeks are going by and I'm not seeing the media
blitz that Atari promised. This time I really got to believe that Atari was
going to take advantage of their technological marvel and run with it. But
it has been a couple months now and I haven't seen a single Jaguar ad on
TV nor have I seen them in the stores here. Everyone has wondered whether
Atari had the cash to really make some large runs and go for it. So far
I have no indication that ATARI has the resources to fill enough stores to
make the Jaguar a mainstream machine--at least in time for it to establish
a foothold before the other manufacturers come up with their own machines
with similar features. Their window of opportunity is closing rapidly.

RM>possibly why it had such great graphics for its time; it's easier to
RM>replace the CPU than the video output!

Not exactly, the Atari was designed with split video at its core.
Split video is of course better than regular composite. To split to
RGB you would take the CHROMA line and separate the color components.
I don't know if separating off of Chroma would be any better than
separating out of COMPOSITE. But it sounds like it would be.
It would be best to run an external system ala an Austin-80 board and
turn off ANTIC and run directly on the external video system. Either
off the PBI or the cart port.

This would primarily be for ANSI text use at best. I don't think
it would be easy to do bitmap off that kind of system without having
VRAM onboard since if it has to go through the PBI for DMA to look
for screen ram, and the refresh rate of the video is so high, it will
not be able to access the RAM fast enough due to the clock speed
limitation since everything has to share the same lines.

JJ>The biggest thing that turns me on about the 65802/65816 is the new
JJ>program counter relative opcodes, which makes things REALLY truly
JJ>relocatable, and of course the new 16 bit registers. It not a 65816,
JJ>then at least a 65802.. so that we can have these. Really putting the
JJ>65816's 24 bit address bus to use is impossible without bringing out some
JJ>sort of 24 bit version of the PBI port, or putting your who darn
JJ>motherboard in a PC case, and build a daughter board with
JJ>slots.

Yes, I hope this 65802 idea doesn't just disappear. Maybe I should talk to Chuck Steinman about a "T802". It might be a better seller than the T816 was. It could be like the Gumby, an upgrade you can do yourself off a text file, but Chuck could sell pre-assembled units. Now that we have an assembler from John Harris that supports the 65802 it wouldn't necessarily be a hack without any development software.

I should also remind you that your math coprocessor discussion has not been forgotten. Perhaps you should update us in this conference as to what progress you have made theorizing about a math coprocessor/ multi OS in a SRAM package...

804. Atari 800 technical questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-27 19:50:35 UTC
From: jgondek@cs.uoregon.edu
Message-ID: <2kqtib$scj@majestix.cs.uoregon.edu>
Source record: 102885

I am currently restoring an old 16K atari 800 and I have a few
questions:

There is a white knob (potentiometer?) on a card that is inserted
behind the standard card storage compartment. What does this knob do?
Furthermore, what is the purpose of this card?

There is a knob on the main board (surrounded in a pink encasing)
that can be turned with a hex-head driver. What is the purpose
of this knob?

Finally, how can I tell by inspection if this machine has the
CTIA or GTIA chip? So far I don't see any chip labels that
indicate either (but there are a few chips under the plastic thing
surrounding the cartridge ports and card slots... I havn't removed
that part yet.)

Thanks for your help...

805. PC Xformer (Atari 8-bit emulator for DOS)

Newsgroup: comp.sys.atari.8bit
Date: 1994-02-27 21:26:08 UTC
From: darekm@microsoft.com
Message-ID: <CLwJJL.HrL@microsoft.com>
Source record: 102886

I've seen various posts recently talking about an
8-bit emulator for the PC and where to get it.
The one I'm working on, PC Xformer (an MS-DOS
port of ST Xformer) is not in beta testing
or yet available anywhere, so claims about
it sightings should be taken with a grain of
salt. It read one post about an emulator
that requires SuperVGA 640x480x256 mode.
That is not PC Xformer. So let's lay some
rumors to rest.

I did show an early version of PC Xformer about
2 years ago at the Chicago Atarifest and I will
be showing a more complete version of it next
month at the Sacramento Atarifest and passing
out some information about it. Since most people
would never be caught dead in Sacramento,
MAIL me (not email) your name and mailing
address and I'll send you that info:

Darek Mihocka
14150 N.E. 20th St. #302
Bellevue, WA 98007

Here is a quick summary of what PC Xformer
does and major changes from ST Xformer:

- runs on any 286/386/486/Pentium or
non-Intel processor that emulates at
least a 286.

- full speed emulation on roughly a 386/20.
286s will run slower. A 486/66 emulates 8 times
faster than normal. Fast enough? <grin>
An option allows you to slow down to roughly
normal speed.

- requires a VGA card only, not a SuperVGA,
since it uses 320x200x256 mode. Overscanned
programs don't go beyond 320x200.

- GTIA, DLIs, and PM/G are supported.
(unlike ST Xformer which didn't support any
of those graphics features due to the slow
speed of emulation and crippled graphics of an ST)

- at the moment, no support for using the
Xformer Cable. Transfer your 8-bit files to
the ST using the Xformer Cable and then use
those files on the PC, or use SIO2PC.

Other info (such as a compatibility list,
beta testing info, etc) will be mailed out
later on, so send in your mailing addresses.

I don't read this newsgroup on a regular basis
so please send questions by mail.

- Darek

jharris@cup.portal.com (John D Harris) writes:

>Chris,

>This machine would not be affordable for the standard Atari enthusiast.

>I don't know what's in the custom 6502C Sally chip that Atari uses, but if
>it's not too complex, a little plug-in board containing a 65802 and the
>extra 'C' logic would certainly make a neat upgrade.

> John Harris - jharris@cup.portal.com

He's right Chris. The Apple IIGS (my computer) used a similar method you are talking about: it has a 65C816 with the custom chips required for Apple II compatibility plus the required hardware for 24 bit memory addressing etc. In my opinion, one of the main reasons it didn't really get off the ground is cause Apple charged too much for it (so, what else is new huh?). But because of it's relatively complex design (GLU logic, Apple //e on a chip, fast and slow side of motherboard and a few others), It actually cost more to build (at the time) than a Macintosh.

While the 65802 doesn't have the 24 bit addressing, it is pin compatible with the 6502 and would only take modifications to the assembler in order to support the new opcodes...

Good luck on this project everyone! May the Atari 8 bit live long and prosper!!!!!

I still have a three slave multiplexor system that I'd like to trade off.

This system allows you to have a complete, in-house LAN system running off your 8bit Atari's.

If you need more than one simulatenous Atari running, then this MUX is for you.. Allows you to chain ALL peripherals, to one file server, and attach up to 8 more slaves all sharing those same peripherals.

Works great with disk drives, printers, hard drives and almost every other peripheral, except modems.

Speaking of "crash"...
I ftp'd the thing today and so far, all I've been able
to get it to do is print out the docs to the screen and to
a file. Everything else that I've tried just locks up and
requires a re-boot. Not knowing German hasn't helped at
all as you would expect.

I knew it was too good to be true. :-(

Of course it is not worth it. just go ahead an pirate instead, it'll get you what you wanted: the software, and probably help another company go bust in the process. I mean that is what we all want isn't it? To give the 8-bit another kick in the face. (In case anyone has only just woken up... read that last paragraph sarcasticaly)

There was a time not so long ago when things were the other way around, there was lots of lovely software over in the States and most people on this side of the water could only drool at it, the choice was to either pirate it or pay the extra cost of importing it. Some people took one option, the rest took the other or just went without. For the time being things would seem to be the other way round, but for how long? How long will it be before the support on this side of the water dries up too? And it IS happening.

I disagree with your views, pirating in any of its forms something to be avoided if we still want people to produce new and re-release old software. If you are not willing to pay the price, then go without. I reckon that is how capitalism and free market works isn't it?

> And who wants to buy

> [that of course, requires that the foreign vendor have
> a reliable return policy as well]
Surely most stuff sold today falls into that category, whether you buy it in the States or elsewhere. I mean unless you can actualy go down to your local shop and play test a game several times.... Even screen shots will not give you a very good idea of how a game plays. Anyway does anybody anywhere take the "I don't like this game therefore I'm returning it" excuse?
Does anybody provide full satisfaction or money back guarantee when it comes to software? Surely such a thing would encourage piracy:
Pirate sends off for game, copies it and send original back saying "I didn't like it, I want my money back", and ends up with a free game.

>

Even under such circumstances I can't beleive piracy is the correct policy.
Surely a much better path would be to campaign for the product to be released
into the P.D. and then you could copy it legaly. Piracy just serves to knock
down the few remaining companies. And just in case you're wondering nearly
100% of UK companies are either defunct or won't touch the A-8bit too, all of
those left are because the people running them are A-8bitters themselves.

> for a miracle just means that miracle is even farther
> from happening than before.
And a miracle is what we need :-)

> The 8-bits are dead, the
> infrastructure that supported them is dead, and the
> number of people that still use the things is pretty
> close to dead as well. :-)
Not quite true, certainly the user base and infrastructure is no where near
as big as before, but some does still exist, but that too is dying, piracy
will only help it die even quicker.

Nothing personal, I just don't feel that piracy is the correct avenue under
any circumstances.

As always all opinion are my own, if you want to thump anyone then thump me :-)

|>
|> Okay, what does that mean?

Atari is probably using the standard Linear Feedback Shift Register (LFSR) technique. See Lancaster's _TTL_Cookbook_ for a good explanation.

Basically, you take a 17-bit shift register (I assume you shift left, where bit n goes to bin n+1). You create bit 0 by doing an exclusive OR of two or four of the upper bits (I forget which ones). If you choose the correct bits, you will get a sequence of (2^17)-1 numbers in a pseudo-random sequence. If you choose poorly, you'll get a shorter sequence. You do a four-bit exclusive OR by XOR'ing two pairs of two-bit values, then XOR'ing the results. Skim off the 8 LSBs, or actually any 8 bits you want.

The numbers seem to have short-term non-randomness, in that they seem to be multiplied by two quite often, but if you skip around (say take every eighth number) you'll appear to have quite random numbers. Since a program rarely samples every clock (and I assume POKEY clocks this thing at 1.79MHZ or whatever AUDCTL tells it to) you'll notice no correlation between your numbers.

There are probably fair means of generating truly random numbers, by feeding an LFSR with the noise from a reversed-biased transistor, but I doubt Atari did this inside POKEY.

I FTP'd it too and have gotten it to run, although not very well. But I suspect this is as good as it gets right now, since it was described as extremely under development. This is an understatement. ;)

Are you loading your VESA driver before you run the emulator prog? If not that could be causing the crashes.

My experience thus far: The emulator runs but there are rainbow patterns displayed in the top 1/3 of the screen. I get a very small window with the ATARI screen, which is not updated properly and has black lines running through the blue background at times. Also, the "top" of the screen starts about 2/3 of the way down, and the cursor wraps around to the physical top of the window as I press RETURN to move the cursor down. I haven't attempted any load or save operations yet. Oh, I get sound too from the PC speaker.

Here are my two questions:

1) Is this emulator still being developed (please say YES!)

2) Does anyone have a translation of the documentation?

I recently videotaped a M.U.L.E. session for a friend who is thinking
about making a clone for the Amiga. He pointed it out to ME that Irata
was Atari in reverse. He said he remembered figuring it out back in his
C64 days, so I'd guess that the name stuck for the Commodore version.

|> Furthermore, what is the purpose of this card?

If this is the pot that you can see along the seam between the ribbed top cover and the body, it's the voltage control for the chroma tuning circuit. See my article on pg. 24 of Atari Classics Dec. 93 and Ben Poehland's article on pg. 29 for more info.

|> There is a knob on the main board (surrounded in a pink encasing)
|> that can be turned with a hex-head driver. What is the purpose
|> of this knob?

This sounds like the RF tuning. Do you mean one that you could access from the bottom of the 800 if you had a long enough allen wrench? Or from the top if you have taken out the keyboard? Use this to tune the sound to match the picture when you are using the RF cable out to a TV's antenna hookup.

|> Finally, how can I tell by inspection if this machine has the
|> CTIA or GTIA chip? So far I don't see any chip labels that
|> indicate either (but there are a few chips under the plastic thing
|> surrounding the cartridge ports and card slots... I havn't removed
|> that part yet.)

Anything built after about 1982 used the GTIA. Some of the old mags included programs to visually check for this. One program could even determine which you had without you having to look at it.

While you got your 800 apart, check that the metal shield on the hinged door hasn't started to fall off. All the ones I've seen recently (that were built with said shield) have fallen off due to the foam rubber decomposing to sticky gray balls of gunk (scientific terms). Don't try to fix it "in place"; remove your door (hopefully you have the thumbscrew version), take it outside and scrape all the foam rubber residue off. Try not to let this gunk get inside your cartridge connector. Reglue your shield using something like hot-melt glue or "Shoe Goo II" (stuff to repair tennis shoes I happened to have in my garage). Most people probably just chuck the shield, however.

As I have the c64 emulator and M.U.L.E. for it, surprisingly it still is IRATA.
I thought that was kind of ironic though....
Eric

824. Nintendo M.U.L.E.: bad news

Newsgroup: comp.sys.atari.8bit

I've never seen MULE for either the C-64 or IBM, and I can't see the point in either, as you couldn't play with the full four people. Maybe you could have two people share the keyboard or something, but I'd think that'd be more trouble than it's worth. I still play MULE just about every day on my Atari 800, and it still provides a good deal of challenge when I'm playing with other MULE sharks. I'm continually amazed at what the guys at EA did with 48k...

I was interested in playing MULE for the Nintendo, but once I did, I was totally disappointed. Once your character gets outside the store, it moves at light speed all over the planet, so you could conceivably install six or seven MULEs on one turn. You can also catch the wampus more than once in a single turn, and couple that with the aforementioned lightspeed movement, and you can catch the wampus nine times. I think these two changes rob the game of a lot of strategy, and turn it into more of an arcade game for a broader Nintendo audience. Besides, you need that silly four-score thing to play with four people.

Now what I'd REALLY be interested in would be a version of MULE playable over a small network of PCs, like the one my roommate and I have in our dorm room.

I posted something about this before, but does anyone know where I could get a new MULE disk? Mine's getting a little frayed around the edges. What I'd really go for would be a MULE cart, but I don't think those ever existed...

Anyway, that's my bloated two cents.

-Jeff

825. Re: Atari 800 technical questions

(Jay Gondek wants to know if his 800 has a gtia or ctia.)
Poke 623,64. If the screen goes black, you have a gtia, if not
you have a ctia. If you don't have BASIC, then the cpu board
at the very back of the machine slots, the gtia/ctia is
then large ic near the edge of the card. The gtia is CO14805-??,
the ctia is CO12295.

I am looking for several 8-bit publications:
DE RE ATARI
ANTIC 1 & 2
Analog 1-8
If you have any of these, please E-mail me with your price.

I'm also possibly interested in a MIO or Black Box.

Thanks, Jim Graham

MF>screen burn in, minimal cabinet degradation for approximately U.S.$120!
MF>Now, I'm hearing talk of Atari and other software manufacturers taking the
MF>initiative to re-create some of the old arcade favorites of the early 80's
on
MF>the Jaguar!!! (Tempest 2000, Sinistar (not confirmed), etc.)

I just heard a rumor from the Carina net that they are going to do a
Star Raiders 2000! That would be great wouldn't it?? Add a little sense
of linear continuity between the 8-bit and SOMETHING, there was never much
of a link between the 8-bit and the ST was there? Plus, this would sure
prove that Atari Corp. can not rip the 8-bit as "dead technology" while the
same time looting its bones for a new product. If it weren't for SR, many
things may have gone differently for Atari, it was vital to the initial sales
of the 400/800 and also launched the 3-D craze, with all the 8-bit machines
struggling to do as good a job as SR and failing (like Elite on the Apple
II).

>it'll get you what you wanted: the software, and probably help
>another company go bust in the process. I mean that is what we
>all want isn't it? To give the 8-bit another kick in the face.
> (In case anyone has only just woken up... read that last paragraph
> sarcasticaly)

Beyond the sarcasm, I find that view to be pretty
specious when you consider we're talking about
Bounty Bob Strikes Back. NOBODY has yet found a
source to purchase this game from. Do you know
something that we don't?

>There was a time not so long ago when things were the other way
>around, there was lots of lovely software over in the States and
>most people on this side of the water could only drool at it, the
>choice was to either pirate it or pay the extra cost of importing it.
>Some people took one option, the rest took the other or just went
>without. For the time being things would seem to be the other way
>round, but for how long? How long will it be before the support
>on this side of the water dries up too? And it IS happening.

And then what will your views on pirating be when
support on both sides of the water have completely dried up?

>I disagree with your views, pirating in any of its forms something
>to be avoided if we still want people to produce new and re-release
>old software. If you are not willing to pay the price, then go without.
>I reckon that is how capitalism and free market works isn't it?

Yes. That's why Canadians cross the border here to buy
U.S. gasoline and cigarets, and U.S. citizens cross over
into Mexico to buy Reeboks and liquor. :-)

>> And who wants to buy
>> something sight unseen as well? I find it very

>> dificult (personally) to rely on descriptions of
>> software that I've seen presented here on the net
>> in text only. There are no 'screen shots' to help
>> persuade, and if I'm ultimately unsatisfied with the
>> product, then who pays for shipping to return the stuff?
>> [that of course, requires that the foreign vendor have
>> a reliable return policy as well]

>Surely most stuff sold today falls into that category, whether you
>buy it in the States or elsewhere. I mean unless you can actualy go
>down to your local shop and play test a game several times.... Even
>screen shots will not give you a very good idea of how a game plays.
>Anyway does anybody anywhere take the "I don't like this game therefore
>I'm returning it" excuse? Does anybody provide full satisfaction or
>money back guarantee when it comes to software? Surely such a thing
>would encourage piracy: Pirate sends off for game, copies it and send
>original back saying "I didn't like it, I want my money back",
>and ends up with a free game.

I guess you'll just have to be more careful of
where you purchase your software. Nevermind the
point about copying software, suppose you get a
defective product and then have to return it?
Will the overseas vendor pay shipping, etc. for
the replacement? I don't think so.
Another example of the economy and capitalism at
work, eh? :-)

>> I'm sorry, but I have to go along with what was said
>> previously. If the item in question is not being sold
>> anymore and the original company is defunct (nearly 100
>> percent of the US companies) and nobody on the vendor
>> list carries it, pirating the thing seems to me to be
>> a viable alternative. Every day that goes by, wishing

>Even under such circumstances I can't beleive piracy is the correct
>policy. Surely a much better path would be to campaign for the product
>to be released into the P.D. and then you could copy it legaly.
>Piracy just serves to knock down the few remaining companies.
>And just in case you're wondering nearly 100% of UK companies are
>either defunct or won't touch the A-8bit too, all of those left are
>because the people running them are A-8bitters themselves.

Read the discussion elsewhere in this newsgroup about
releasing products into the Public Domain. Outside
of magazines like A.N.A.L.O.G. and COMPUTE!, very little
has been released, and no progress is being made at all
on locating the copyright owners/licensees for the rest.

>> for a miracle just means that miracle is even farther
>> from happening than before.

>And a miracle is what we need :-)

Amen brother!

>> The 8-bits are dead, the
>> infrastructure that supported them is dead, and the
>> number of people that still use the things is pretty
>> close to dead as well. :-)

>Not quite true, certainly the user base and infrastructure is no
>where near as big as before, but some does still exist, but that
>too is dying, piracy will only help it die even quicker.

Doesn't seem to hurt the MS-DOS world very much.
But then there's really no need to engage in the
practice of piracy on a user level on that platform.

>Nothing personal, I just don't feel that piracy is the correct
>avenue under any circumstances.

In a perfect world I would agree.

>As always all opinion are my own, if you want to thump anyone
>then thump me :-)
>Raphael Espino - rje@cs.nott.ac.uk

Thump!

834. Atari 8-Bit Computers: Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-01 20:17:20 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2l07sg$rcj@usenet.INS.CWRU.Edu>
Source record: 102715

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 15-Feb-94

Additions/suggestions/comments/corrections having to do with this
FAQ List are welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The Atari 8-Bit Computers FAQ List is posted on the 1st of the month to the
comp.sys.atari.8bit/Info-Atari8 Digest discussion group. A fairly
recent copy is available on the Atari Archive (see below) as the file
8bit/faq.txt, but the most recent copy may always be requested from
mcurrent@carleton.edu.

What is this FAQ List for?
The Atari 8-Bit Computers FAQ List was created to provide answers to many
commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest
discussion group. At this time the FAQ List is heavily geared toward
describing the various resources for the 8-bit Atari user available, with
relatively little information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
```

rec.games.video.arcade (includes products by Atari Games)
rec.games.video.atari (Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by John Dunning, jrd@stony-brook.scrc.symbolics.com.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. John Dunning would like this fixed, but needs help; if you are an accomplished UNIX programmer please contact him.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
The Atari Archive is that section of the University of Michigan/Merit Software Archives that holds a huge number of files covering all Atari products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.165.41) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.1) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit Software Archives mirror site, but there's no guarantee the site you're taken to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher client, try the command "gopher gopher.archive.merit.net 70" to connect directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.165.41)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files (.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file

describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.1)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.32, 129.22.8.51). Applications for
free accounts are handled online, or you may browse the system as a visitor.
Once logged-in, type "go atari" to reach the Atari SIG. Those who add their
names to the Atari SIG user directories are automatically members of the
official Atari user group C.A.I.N. - Central Atari Information Network.
Send correspondence and press releases to xx004@cleveland.freenet.edu.

bi-monthly

What product developers or vendors support the 8-bit Atari?
There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the Atari 8-Bit Computers FAQ List, and is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.txt, or you may contact the maintainer at mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari
users should treat themselves to either MYDOS or SpartaDOS to appreciate the
power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides
subdirectory and hard-drive support. SpartaDOS is a completely different
command-line DOS modelled after MS-DOS, though it is perfectly capable of
reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS
X is cartridge-based and includes many additional features. While it's hard to
argue that SpartaDOS X is not the most advanced DOS available, it is a
commercial product that is no longer manufactured. MYDOS, on the other hand,

is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for
complete compatibility with existing software, and then choose either SpartaDOS
or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs
available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS
800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

Where is my nearest 8-bit Atari BBS?
The "ATARI CLASSICS Atari Bulletin Board System listing" is maintained
by Lawrence Estep, AC's Telecommunications Editor, 71450.1050@compuserve.com.

Where is my nearest 8-bit Atari user group?
An 8-bit Atari user group listing is maintained by Atari Classics
magazine's Exchange Editor, James King, KAMARO_KID@delphi.com.

838. Hard Drive on Serial Port (?)

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-01 21:07:01 UTC
From: mameyer@solaria.sol.net
Message-ID: <2l0apl$p2k@solaria.mil.wi.us>
Source record: 102719

I'm in the middle of a project to add on to the serial bus, a hard drive. I'm trying to keep the cost way down, so I picked a 20 Meg IDE drive that currently sells for $29.00. I will be adapting it to an existing drive control by pulling out the disk chip and installing the 40 pin IDE header and chips for the IDE drive. (There are 1200 drives at the place that I bought my 3 drives from, so hopefully there will be plenty for anyone else that wants to do this).

I am currently writing the software to replace the EPROM in the existing disk drive controller and have come up with some questions that my current documents don't seem to cover.

1) When putting drives into the high speed, warp speed mode like the 1050 can do; is this a command sent to the drive? If so, what is it and what response is it looking for?

2) On a format command, a bad sector list is sent back, if any exist, but MYDOS 4.5 doesn't allow bad sectors. On a floppy you would just throw out the disk, but on a hard drive you can't do that. :)
So do I need to lie and say all is well and then have a seperate program on the Atari to analyze all the sectors and map out the (if any) bad sectors?

3) Does such a program exist for the parallel port drives that could be made to work on my serial port?

4) In looking at the 4 status bytes sent from a drive to the computer, 1 byte was from a register in the disk controller chip which doesn't exist in the hard drive. So do I adapt the ones that have meaning for the hard drives and fudge the rest.

5) Last of all - is anyone else interested in such a project?

Marc Meyer

Oh yeah... well, it works, BARELY! Not only does it unnecessarily open a
640x480 screen, of which it only uses 320x200 of anyway, despite the Atari's
ability to use overscan... not only that, but the screen scrambles itself
to hell... It can't make up its mind which line is which.

It may not be pertanent to your specific IDE drive, but many of the smart
IDE drives handle bad sectors internally, and look 100 percent good sectors
to the computer interface.

Source record: 102724

On Tue, 1 Mar 1994 01:47:48 GMT Robert Jon Sales mumbled:
:~ I am looking for an 80 column terminal for my Atari 800. I have
:~one called Omnicomm, but its hard to use. Anyone know of a good one I can
:~get? Thanks.
:~ sales@oswego.oswego.edu

There's the old standby: Kermit65 v3.7. It has the same 3-bit graphics characters as Omnicom, so unless you can put your hands on an 80-column card (unlikely, unless FTe does something of the sort!) you'll have to get used to it. I did! I'm sure K65 is available for download in the archives...

>While the 65802 doesn't have the 24 bit addressing, it is pin compatible
>with the 6502 and would only take modifications to the assembler in order
>to support the new opcodes...

And the modifications to the assembler are already done. My assembler
already supports the full 65802/816 set, including 24 bit addressing.

Thanks to those that supplied info about the additional functions on the
Sally chip. It should be pretty easy to put that on a board with a 65S802
and see if it works. I think I'll try it with a regular 6502 first, to
make sure the board idea works.

It might be awhile before I can get to this test though.

847. Support for your Atari 8-bit.

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-02 13:18:30 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9403021318.AA04744@cs.utexas.edu>
Source record: 102728

SUPPORT FOR YOUR ATARI 8-BIT FROM RICHARD GORE.

YORKY 256K Memory upgrade:

Yes, its still available but in dwindling quantities. The Yorky 256k
memory upgrade simply plugs into the PBI port of your 800XL or a 64k internally
upgraded 600XL and gives you 256k of XE type compatible bank switched memory.
You don't have to open your machine or do any soldering, its supplied ready
to be plugged in and used. An A4 manual and a double sided disk of support
software are included in the price.

Price: #50 plus #2 p&p (UK), #3.50 (EC), #5 (worldwide).

(also for US customers $90 fully inclusive).

I also hope to have ready very soon, a new version of the Yorky with a PBI
feedthrough to allow the connection of another PBI device like the Black Box.
More details will be supplied when everything is finally sorted out.

SOFTWARE:

JAWBREAKER - The classic Pac-man style game originally sold by Sierra-On-Line.
This version includes two mazes which were originally sold as
separate games as well as a new pause function and improved
joystick control.

MOUSEKATTACK - Another classic game from Sierra-On-Line. This game has you
trying to plumb the levels of Rat Alley. A very addictive game
featuring a one or two player (simultaneously on screen) mode,
new pause feature and improved joystick control.

Both games are available on disk, tape or Rambit Turbo tape (state which)
and are supplied with a printed manual.

Prices: #4.50 each or #6.95 for BOTH (UK p&p included)

(overseas please add #2 for airmail shipping)
(US dollar prices $10 each or $18 for both fully inclusive)

For further details or to order contact:

RICHARD GORE, 79 SPROTBROUGH ROAD, SPROTBROUGH, DONCASTER, DN5 8BW, ENGLAND

Telephone: (0302) 784642 weekends only please.

E-mail: RG9@UK.AC.YORK.TOWER or RG9@UK.AC.YORK.VAX
(Non-JANET users invert UK.AC.YORK.xxx to xxx.YORK.AC.UK)

- -

SOFTWARE Authors, have you written any games or utilities for the Atari 8-bits, new or old? If you have and you have the rights contact me now and we can hopefully arrange to get them (re-)marketed!

: faster than normal. Fast enough? <grin>
: An option allows you to slow down to roughly
: normal speed.

Ohhh... Not bad.. Although, other people got 6502 emulators running on the 68000 a litle faster than you did.. So, maybe other people can get your Intel code to run faster, too... :-)

: - GTIA, DLIs, and PM/G are supported.
: (unlike ST Xformer which didn't support any
: of those graphics features due to the slow
: speed of emulation and crippled graphics of an ST)

How are the ST's graphics crippled compared to the PCs, at this resolution? Are you talking about having to deal with bit-planes, instead of the easier byte-per-pixel? Or what?

(I don't need flames from everyone - I know Darek from quite a while back, and have had this 'discussion' with him before..)

I guess I should have mentioned two things, one positive and one negative.

1. What DOES work, works well. I think it even has DLIs, since the self
test keyboard screen uses them to make the "Press RESET" different colors
than the keyboard.

2. What DOESN'T work makes it unusable... either that or the German docs
which seem to be stored in some weird unknown format where TXT would
have sufficed, are supressing some super secret that allows you to get it
to the point where at least the screen is in working order.

>ps. I get asked why not put your stuff up. this is why.
> They aren't critics but animals.

Well, one thing's for sure, don't put it up without getting it to the point
where it's usable for _something_... i.e. pre-pre-pre-pre-pre-beta releases
like this one, should have been worked on a bit more before being put up.
One thing's for sure, it definitely wasn't put up by the author.

That is one of the points that I think some people are trying to alude to.
If we on the net that have worldwide access don't know about these new
releases, how are the people without net access that are still using their
8bit computers supposed to find out about these releases? And don't
suggest moving to Europe. That's not an option for a lot of us. :-)

Cross-posted to: ont.micro,kw.micro,uw.sys.atari,comp.sys.atari.st,comp.sys.atari.8bit

In March, the Kitchener-Waterloo Eight Sixteen Thirty-two (KWEST)
Atari user group will have a general meeting.

Our 16-bit library currently has over 400 disks of public domain
and shareware software.
In addition, there will be our updated catalog disk and our
disk-of-the-month.
Our 8-bit library is also available at this meeting.

As well, we will give attendees a copy of our own newsletter "The Hard Copy".

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

Meetings held at the University of Waterloo in the
Math & Computer Building.

Room opens at 7:00 pm. Meeting starts at 7:30 pm.

Wednesday, March 9, 1994
DCS Course Room, Room 2009 (2nd floor)

Call 725-2068 for more information.

Hope to see you there,
Dani Roloson

Hi
Just found this newsgroup and I thought some of you might be interested to hear that those of you who have PC's (386+) can get a lot of classic Atari games right off the net. They run under the excellent Commodore *cough* 64 emulator that is also available for free. Now I used to be just as much of an absolute Atari 8bit advocate as many of you here probably are but this emulator allows me to play Archon I, II, M.U.L.E., Bounty Bob strikes back, Fort Apocalypse, Choplifter, Necromancer, Drelbs, River Raid, Pitfall II and loads others again so I'm not about to complain. Let's face it, these two machines share essentially the same classics.
The ftp site is watson.mbb.sfu.ca, login anonymous. Go to the directory emulators, get yourself c64s09a and b.arj. Then cd back to the dir games and pick a few. They are in .zip files.
All this is also available from wuarchive.wustl.edu, dir /pub/msdos_uploads/emulators/c64 (They also have the XL emulator there, but that is nowhere near as good as the C64 one :().
Regards, Michiel

I seem to remember there being a version of Star Raiders for the ST. I never saw it, but I saw the review.
I actualy saw a Jag on TV the other night, on Games Master which is one of those video game T.V. shows over here which seem to have become popular. They played Cybermorph on it, and if that was anything to go by then the Jag is a very mean machine, I bet they could do a brilliant job with S.R.
I wonder if it will be as playable as the original tho'. Can ANYTHING beat the original S.R. on and 8-bit?

Didn't you read my posting "HDI (was Re:...)"? I wrote, that the best
way to get the schematics to build the HDI is to contact Jim Harris
(sorry, I don't have his address). This is probably much cheaper than
getting it from Atreju (if he were willing to send it, it would cost you
at least $20). Perhaps some guys here in Germany will make some of
them again, but this would cost you $150-$200!

Again, if you want to build one, you'll have to get a 4MHz 65C32,
which is probably hard to find!

Bye,
Jochen

P.S.: If you want to have the fastest copier for the XL, watch out for
the Super-Speedy (for the 1050): 4 secs. to read a diskside, 7 secs.
to write it (with formatting) B-)

The 130XE is a very good atari computer, but it does have its shortcomings... One of the major problems is that the machine can't run some of the older programs, DRELBS for instance is an excellent classic game that can't be played on a 130xe (disk Version). Some of the older cartridges do not work either.

Though this may seem an obstacle, there is PD software that allows you to emulate an 800xl, I believe it is called the translator. This software will allow you to run those ancient but addicting classics. But there still isn't (as far as I know) a version that allows you to play some of the cartridges...

Other than that, I was blessed to get a 1200xl, the best keyboard of the lot, though that machine is just as quirky as the 130xe, but not in the same areas...

Ive got one of those laying in the closet. I dont have the original software that came with it, so Im of no help there, but I do remember running the 720k drives without incident. I used to use Sparta exclusively, and dont remember have to run any driver to use the ATR except for an RS232 handler.

Also, do you have any info on the hard disk interface? Is this item currently available, or is it a thing of the past?

See ya, Joe

LM> as the Adaptec 4070...the RLL version of the SCSI-to-ST506 controller).

Heres a stupid question (or two):

I have, inside a case for my ST stuff, a 3527A. I want to loose it and go with a straight SCSI drive for the ST, leaving me with a 3527A and about 200 megs worth of RLL drives that are currently hooked up to it.

Now, if I go out and purchase a Black Box, can I hook the Omti and the drives right up to it? Would I be flying with a hard drive on my 8 bit, or what?

See ya, Joe

I used to own a 130XE (unfortunately, when push came to shove - I had to sell
all my Atari 8bit stuff a few years ago, but I try to evesdrop here...).

My guesses why some people prefer the 800XL are 1) better keyboard.
With each new machine, the keyboard became just a bit worse; the straight
800 had the best keyboard of any 8bit. 2) the 800XL has a separate
cartridge port from the PBI port. The 130XE combined both into an
*enhanced* port. Unless you have something like the splitter sold by
ICD for the MIO, you can't have both a cartridge (like Sparta X or
one of the language carts) AND a hard drive.

I owned a splitter, so it was no problem for me. I also installed the
1200XL function keys in a diamond pattern so I had one key cursor control
(both the XL and XE lines' OS and keyboard decoder chips support the
1200XL function keys - Atari just didn't install them from the 600XL on).

Michael Current stated he didn't believe the pay services would have allowed Analog software to be uploaded if Analog hadn't already released the material into the PD. Michael wisely also stated he couldn't confirm whether in fact the material had really been relased; he was apparently obly making an inference on the basis of the observation that the pay services were accepting the uploads.

I know a little bit about this as I got involved in it a couple years ago. In the normal world, I think Michael would be correct to conclude magazine software residing in a pay service archive is PD. (My opinion.)

But peoples, this is NOT the normal world. This is the ATARI market we're talking about here, where things are ALWAYS done a little differently.

Definition of "a little differently": sloppy, slipshod, laid-back & half-assed. A vendor community whose attitude about the finer details of software legalities might be expressed as, "Details?? We don't need no stinking details!" Yes, much of our present murky situation about what's PD & what isn't stems from the failure of the vendor/developer community to carry through properly even when their intentions are good.

One problem. With magazine software the various magazines had a variety of policies regarding rights. Sometimes the rights were held by the author of the article in the magazine, other times the rights were retained by the magazine itself. In the case where the magazine held all the rights, & gave permission for the old material to be uploaded on commercial pay services, you can MOSTLY be safe in assuming that material is PD. But for material where sometimes it was the author's & sometimes the magazine's, you got a mess. Because people just uploaded everything, & the commercial services have no way to tell which items are still the property of the author & which belonged to the mag. So they stuck their necks out & accepted everything. Theoretically it would only take one lawsuit by one author to force the pay services to delete his material. And you know darn good & well the pay services will cover their butt & just delete everything, since they can't tell what belongs to whom. The spectre of ALL the magazine software being lost in this scenario is real. No one seems to appreciate just how fragile the pay service archives are, nor the extent to which the pay services have exposed themselves just to protect the published software legacy for a few hundred Atari 8-bitters.

Another problem. To the best of my knowledge, the arrangements the pay services have with the magazines for permission to allow software uploads are really sloppy. I mean, nothing tangible that couild stand up in court. It was mostly done in the "old boy" style of conducting business, since many of the pay service Atari people are/were connected at one time or another with the various magazines. A pay service sysop calls up a magazine dude & says, "Yo, dude, you mind if people upload your old Atari 8-bit stuff to our library?" And the mag

dude says, "Oh hell, we don't care about that old 8-bit crap any more." (Notice, the mag dude doesn't even say the word "Yes".) So the sysop just assumes that it's OK & allows the uploads (& of the course, the MANY downloads). But, uh, hey guys, how about a piece of paper, where this stuff is written down somewhere, maybe even a signature or two, & dated? Hah! You gotta be kidding! So, all the pay service archives are built on nothing more than a little behind-the-scenes jawbone action. Legally speaking the whole structure is rickety as hell, one good lawyer could probably blow it all down without even taking a deep breath.\

My personal experience in the Atari vendor/developer community has really been an eye opener. Cutting corners, doing everything quick-&-dirty, & not bothering to write anything down are the apparently the norms. Write a letter? Too much trouble. Everything is done on the phone, & nothing is ever followed up in writing. I'm willing to bet that Atari Classics Magazine is the ONLY financial endeavor in the entire Atari 8-bit market that had a written, detailed, comprehensive Business Plan. As a scientist I'm used to recording all transactions in detail. When I first encountered this laid-back style of doing business in the Atari community it drove me up the wall. Especially when half the time the agreements made on the phone couldn't be remembered a few months later.

I'll also relate another little gem, a classic in this genre. Last year when I tried to negotiate rights to obtain Turbo-File, I assumed (big mistake), that I would inherit whatever rights MicroMiser had negotiated with ICD for the truncated version of SpartaDOS (SpartaDOS B) that was included with TurboFile. I asked MicroMiser for a copy of his agreement with ICD so I could just copy those provisions into the new contract. Hah! I got stung. There WAS NO written agreement. Tom Harker couldn't even remember the name of the guy who owned MicroMiser & was distributing his product. It was a "phone thing": ICD agreed to allow MicroMiser limited distribution rights in return for MicroMiser saying nice things about SpartaDOS in their manual & urging people to buy the full SpartaDOS Construction Kit. But since it was written down, I couldn't buy it! Part of the reason my negotiations with MicroMiser collapsed was because they wanted me to pay a big chunk of change for their product but would force me to re-negotiate rights to SpartaDOS separately with no guarantee ICD would cut me a deal. MicroMiser left me out in the cold, & I found myself dealing with not one company but two. And BOTH companies had to come thru for me in order for my p

wups... 6 lines above, make that "... NEVER written down..."

me in order for my purchase of software rights to have meaningful value. With no guarantee that either company would come thru for me, & both companies being run by bona fide graduates of the Space Academy who NEVER WROTE DOWN ANYTHING, I decide to cut my losses & get the heck outta there.

Bottom line: with so little of the details of contractual information spelling out who owns which rights, & probably much of what was written having been lost, no body can blame me for having a gloomy outlook on the whole software situation. Whenever I look at it, all I see is quicksand.

877. Steal It Or Go Without

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-05 00:40:05 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9403042357.AA22967@phinet.smithkline.com>
Source record: 102808

Much of the discussion about software rights in this Newsgroup has centered (as usual) around the legality/morality of merely appropriating software when you can't get it any other way. Some feel you shouldn't do that. Others feel it's OK. And some think if you don't buy it legally you should "go without".

I don't want to get ensnarled in the arguments about the legality vs. the morality of buying/pirating software. But it occurred to me that no one has explored the ramifications of "going without".

Suppose you are a person of high personal morals who finds pirating distasteful. You want all kinds of software for your computer which is no longer commercially available & you're sworn not to steal it. So, you go without. When you think about it, "going without" is not really an alternative. A computer without software is a useless piece of junk. I'll assume our mythical high-minded person also has a brain. After "going without" for long enough, he finally realizes the whole thing is worthless. Why have a computer at all if you can't do the things with it that you got it for? Eventually our mythical Atari owner wises up. He comes to understand that no matter how good the hardware is, it is not computer hardware that makes/breaks a computer market.

It's the software.

So he starts looking around to see which computer platform has the best selection of software products. After looking for about, oh, 9 milli-seconds, he discovers I-B-M. Anybody who ever had an 8086/286/386 knows what an expensive mess that hardware is. And then, you can look forward to all the wonderful offerings of MS-DOS (they don't call it "Messy-DOS" for nothing!). The machine, its DOS, & its architecture have the word KLUDGE stamped all over it in giant letters.

And yet, go into any software store & you're in Software Wonderland.

And this, Dear Friends, is how former Atari owners end up in an unholy love affair with big Blue. Because Big Blue has all the software goodies. Oh sure, gimmee my old 800XL any day! But yah know, I can't draw the molecular structure of taxol on my 8-bit. I can't create a professional camera-ready electronic schematic on my 800XL. I can't program a PAL chip with my 8-bit.

You can do all those things <cough!> with a dreadful IBM thingie. Is that DISGUSTING, or what?

So, to stay in the Atari community, I suspect most people will just "do what you have to do". Or else, you leave. And then the community becomes that much smaller. This isn't fiction, either folks. It's happening. Every day. It's affecting Atari Classics. I oughta know, since I'm the dude who counts

the subscriptions & sees the little notes & stuff people write on the forms.

As the Atari 8-bit pond continues to evaporate, I fear the few remaining inhabitants will turn at last to cannabalism, just to stay in the pond. Will anyone disagree that piracy is a form of "software cannabalism"?

Ah well, on to something less depressing.... Dinner!!

It should be pointed out that Data Que has already made a board for both
the original 800 and the xl/xe. When I talked to him last summer, he
said he was only able to sell about 100 and didn't have anymore available.
I think they costed ca. $100 at the time. Anybody try one? Maybe if
enough people had an interest, he might make more?

Does anyone know what Western Design wants for them now? 1 year ago the 802
was $18 but you had a minimum order of $100. I tried to locate another
source but wasn't successful.

I picked up an odd program from a board in Ohio (You may remember Pandora when
it ran Carina, free callback!) that allowed you to either boot normally in
Atari 800 mode, or you cuold hold down some keys and it would flash the
screen, and when you put the cartridge in, it would just run. I forget the
exact procedure though. The docs said it worked 100% of the time, but for
me it worked only 20%.... the cartridge I used was Astro Chase.

I thought that the 130XE O.S. was identical to the 800XL O.S. and that the
main diferences were the extra RAM, the ECI vs PBI and cosmetics. As far
as I am aware the 130XE ROM's are identical to the 800XL (with Rev C. basic).
Are you not thinking of the translator that emulates the 400/800?

From: ulf@antic.sub.org
Message-ID: <5KIHuZJ1S7B@antic.sub.org>
Source record: 102819

Hi !

I downloaded the German XL/XE-Emulator AT800XL.ZIP from WUSTL yesterday. Unfortunately, I cannot get it to run on my system (386DX-40). Well, the VESATST-file works just fine but when I run the emulator with the given parameters I get only a rather small blue window at the top of the screen. Well, I can enter a few BASIC commands or run the self-test but the structure of the XL/XE screen looks very strange - bottom lines are displayed are displayed at the top of the screen and vice versa. Also, the window should be a lot bigger that it is now, I suppose. Maybe I have to run EMULATOR.EXE with different parameters ?! Anybody know ? Any kind of help is welcome.

BraSoft will probably release PC Xformer soon! It's going to be the best XL/XE-emulator for the PC! Stay tuned!

PLEASE SEND REPLIES TO ...

There was just a blurb on the program "Computer Chronicles" Friday.
It was in Atari's price range I imagine, FREE, & seemed to be a very
upbeat report on the Jag & Atari as the company that created the video
game market place. IMHO: This type of word of mouth advertising by
industry pundits can't hurt.

: love affair with big Blue. Because Big Blue has all the software goodies.

Ben,

You have described my delimma (I know I didn't spell that right, but my dictionary isn't handy).

In 1990, I moved from the Twin Cities to a very rural area in Michigan's Upper Peninsula. No 8bitters in sight. I had a very well decked 320XE, SDX, MIO & hard drive, and LOTS of goodies including much of the much sought after productivity (versus game) software - all legit. I knew very well how to move data between everyone else's PCs and my machine, but day in and day out it grew to be a real pain. If I would have had a local user group (as I had in St. Paul), I may have stuck it out.

I needed MS-DOS compatibility, and the only way to afford it was to sell ALL my beloved Atari 8bit stuff. After bundling it all up, I had a stack in the living room about 4 feet X 4 feet X 4 feet. Sold it all piece meal through a friend in the Twin Cites and netted enough for the PC.

While I miss my Atari (and still keep an eye on this group), I don't regret the decision because my PC (and it grew up just like my Atari did) pays for itself doing part time consulting. I would no longer even think of trying to obtain another Atari 8bit system. I took about 4 years of building to achieve the system I had, and now that parts and software are so tight, I doubt I could do again legally.

By the way, while I agree that older PCs were kludges, the newest systems when paired with true 32 bit operating systems and more advanced graphics and sound

capabilities are not. I have finally reached the point where I can say I can do more with a PC than I could with the Atari.

I don't have a convenient full set, but I thought I'd relay something that probably won't be in the other info you may get.

When the CPU is in decimal mode while doing ADC and SBC, the Z and N flags are set according to what they would have been if the bytes had been added in the normal binary fashion. Only the C bit is accurately reflected in decimal mode.

>
> I own an Atari 800 and an 800XL and was wondering what you were refer-
>ring to when you said a "translator that emulates the 400/800"?
I was refering to the translator disk which the person I replied to was refering to (or at least I think he was refering to it, but he seemed to think that it was for the 130XE to run the 800XL O.S. as opposed for the XL/XE series to run the 400/800 O.S. which is what I was refering to, since to the best of my knowledge the 130XE and 800XL O.S.'s are identical - anyone?)
Basicaly the translator disks (there are several diferent ones around) loads into an XL/XE, switches off the XL/XE O.S. and installs the old 400/800 O.S., allowing you to run some of the old games written for the 400/800 which won't run on XL/XE's.

How about moving Europe to the U.S.A. then :-)
>
>I would say the answer is the print magazines. Here in North America that
>would be Atari Classics and Current Notes.
You beat me to it Michael, I was just about to mention the word 'subscription'
Thing is there are a lot of people out there who don't even know about the
magazines (or this newsgroup) even though they have net access, (I've met
several in diferent corners of the net - and pointed them in the right
direction :-)) so you can assume that there are even more people without
access who don't know about it all. Question is how do you reach those
people? With great dificulty I imagine.

One idea, which was recently put into practice by New Atari User - Page 6,
was for individuals to run free personal adverts in local newspapers, which
basicaly say "Atari 8-bit owner looking for other 8-bit owners, please
contact me for more info...", then if anyone replies you can point them towards
the magazines, etc. as well as making new "contacts" for yourself on the way.
Companies obviously have to pay for such ads which make
them uneconomical, but certain publications allow for individuals to place them
free of charge. This apparently has had some success.

I have all the opcodes typed into a data base somewhere. Unfortunately, it's
on my Atari and it's not hooked into a modem (I'm on my Mac). However, I've
got an ISBN for the book that I used to teach myself 6502 programming (if it
will help).

ISBN:0-672-21656-6

Library of Congress #:79-67131

It's very detailed (as far as what each opcode does and the various flags
associated with it).

Guess what? I came across a user group called IMAGE, Indiana-Michigan Atari
Group Exchange.

While their primarily ST oriented, they do have minimal 8bit support.

They show a mailing address of:

IMAGE
PO BOX 1742
South Bend, IN
46634-1742

I also found a club called MAGIC, but
I dont know if they still exist, as I
havent yet gotten any return mail.

Michigan Atari General Information Council
4801 Martin Road
Warren, MI 48092-3491

Hope this helps get you started..

905. The Korner BBS

From: kamaro_kid@delphi.com
Message-ID: <5Q1IPNJ.kamaro_kid@delphi.com>
Source record: 102836

The Korner BBS will no longer be online 24hours/day, 7days/week.

Instead, I've decided to change the number and put the BBS online
weekends ONLY. If you are looking for ANY hard-to-find 8bit software,
then this BBS is for you. I assure you, your long distance call will
pay off by hitting the motherload of Atari 8bit software.

I have over 350meg of 8bit Atari software online..

BBS Stats:

The Korner BBS
Running BBS Express Pro 3.2c (Ansi core)
350meg of HD space (4 hard drives using two Adaptec 4000a controllers)
256k MIO
1meg Newell upgraded (super-beefed up) 130xe
Online 9years nonstop (until now)
Accessible by Hayes Ultra v.32 9600 Smartmodem
801-969-1468 (effective Monday)

Please notate that the BBS will ONLY be online WEEKENDS.. If you
try calling on a weekday, you'll just get a busy signal or an
answering machine.

I have the following EXTRA 8bit hardware items for trade or sale.

800xl w/Omniview 80 chip & software -- $50.00 obo
2 x 1027 NLQ direct connect printers - $15.00 obo
2 x 1020 printer/plotters - $15.00 obo
Okimate 10 color thermal printer w/4 ribbons and 4 rolls paper - $50.00 obo
Percomm data disk drive w/green controller card & printer port - $50.00
3 slave Multiplexor system w/35foot cable - $250.00 obo
2 x 850 serial/parallel interface - $50.00 obo
ADC 1200 baud smart phone modem - $20.00 obo
410 tape drive w/custom dust cover - $20.00 obo
Alien voice box w/all original software - $35.00
Atari TrakBall - $15.00 obo
BEST switchable TrakBall - $15.00 obo
XF551 360k disk drive (cherry condition) - $75.00 obo
US Doubled 1050 (cherry condition, new drive mech!) - $60.00 obo
HAPPY "board" 1050 w/switch & controller board - MAKE OFFER!
XM301 300 baud direct connect modem (in original box) - $10.00
ICD R-time8 cart (I have 4 of these gems, only selling ONE) - Best Offer!

Please note that I'd prefer to trade these items for the following items:

SIO2PC (latest revision) cable with software
US + OS ROM upgrade
TransKey keyboard (complete)
100meg SCSI hard drive
ICD (now FTE) dual port 130xe ECI card
Misc. software

Contact me here, call the Korner BBS (weekends ONLY) at 801-969-1468,
leave me email at: kamaro_kid@delphi.com or call me at home at:
801-969-9782 (Jim King)

>Decent condition?? Yea, I can't remember the last time I ever needed
>to use the space bar... I might trade you for a 130XE with a space bar
>that needs work... Mike (FTe)

OK, sounds like a fair trade to me. (Are you serious?) And it is in
decent condition -- I just pry off a key I never use (right-shift or caps-lock
[in BASIC]) and pop it on the space bar -- voila! Sure, it's not quite as
easy to use , but it works!
And I like your offer... what does 'needs work' mean? Do you need to
smack it to get it to work? Is it loose? Is it fixable? Thanks.

Hi,

A beg to differ, I've backed up up my tape version onto disk, and this loads fine.

It doesn't like Rambo expanded machines however, just bog standard 800XL/130XE's

Mark.

910. Need A Terminal

RJ> I am looking for an 80 column terminal for my Atari 800. I have
RJ>one called Omnicomm, but its hard to use. Anyone know of a good one I can
RJ>get? Thanks.
RJ> sales@oswego.oswego.edu

Kermit65 handles 2400 baud better and has the Kermit protocol.
This is available from the archive. However, even Kermit will lose
characters at 2400 baud after 2-3 screens of continuous scrolling
data. Clay Halliwell on GEnie is working on a new form of 80 collumn
terminal that uses 2 pages of Gr.0 instead of Gr.8 and has been rated
at 14.4K baud capable if not more. However, he has not finished the
VT-100 keymapping and the inverse does not look that good, and his
VT-100 decoding is not perfected.

►►►►> Could someone please post a chart on ASCI/VT100???

Essentially what I need is a chart that shows all the ASCII code,
it's decimal and hex representation, its name, and it's keypress on an
IBM keyboard. For instance, from PICO, you mark things with control caret.
But control caret on an IBM produces a wholly different code on an IBM
than it does on an ATARI, does it not? To produce a key map conversion
you need to know the keystrokes on the IBM and match them to the ASCII
code and choose a keypress for the ATARI.

Likewise, a VT100 control code list would be greatly appreciated.

Any differences between VT100 and ANSI for instance... If Clay
did implement ANSI correctly then perhaps there ARE some differences
because it is not working perfectly for me.

Clay originally designed this program solely with IBMASCII and
ANSI in mind, but I have convinced him so far that VT100 support would
not be too hard considering that ANSI seems to be merely an EXTENSION
of the VT100 command set.

Eventually I also hope he adds a solid Kermit file protocol and
also a backscroll buffer. In the end there is a good chance of at
the very least, 9600 baud text scrolling, depending on how much
throughput is lost when implementing a cut and paste of PMG underlays
to implement blink/brights. The inverse is so hard to read that I
suggested perhaps he use brights instead of inverse when in VT100...
I don't know what he will do. But the bottom line is that there is
a good chance that we will have a VT100 terminal that can cook at
high speed, something which would have been unthinkable with a Gr.8
style display, and this is solely due to Clay's ingenuity.

It makes sense since he wrote CVSQUASH and CSVIEW, the colrview compression and viewers. If anyone is interested also in this project please let me know and I will let him know (if he doesn't read this group already) that there is some interest outside of GEnie for this program. It is only in alpha test so I can not distribute it yet.

Source record: 102842

RM>Is there an XL/XE emulator for the Amiga?

If the Amiga had become an ATARI property as it
was designed initially, than it would probably have
been done back in 1985, but no. There is currently
on Atari 8-bit emulator for the Amiga. This is also
archetecturally ironic because of all platforms, the
Amiga could probably emulate the Atari with the greatest
facility due to the fact that both machines were
designed by the same team.

For instance, the only PC alternative is to run
Gemulator and thence STXformer to emulate an 800. In
order to get anything close to full speed I would think
it would take at least a 486/66 if not a PENTIUM.

However, I am fairly certain that an Atari 8-bit
emulator could run on a 512K Amiga 1000 at its original
7.xx mhz clock speed due to using the analogous chips
of the Amiga to emulate their older cousins, i.e. PMGs
to Sprites, and DLIs to HAMs. This all has to be done
with brute-force software with most other emulators
INCLUDING the Atari ST, although an STe version was
going to use the Blitter for PMGs I believe...

Source record: 102845

Okay guys. I've not had a chance to try the 8-bit german emulator yet. Has anyone translated the docs yet? Anyway, I've (barely) begun work on an 8-bit emulator for the PC. When it is ready, you will know about it. I'm gonna need a good deal of help with it as I've only been using the xl for about 3 years. If there is any source code available for the german emulator, I shall look at it. Is there any other source code knocking around for ANY machine (PC, Unix, Amiga)? If so, can you let me see it, tell me where I can get it, etc.

If you guys have any ideas to be implemented, let me know. If you want me too write this thing, you will have to be patient and let me do it. It's gonna be part time, but once I get back ontop of Assm. I should be able to go quite quickly. Give me support, any information about the XL is useful. I shall initially go for the 800XL, 64k, because this is what I own. Can someone let me have RAW images of the ROM's and the rom for a disk drive (1050?), plus any info on these.

If you want an atari emulator, help me give you one ....oo-er! :)

Zargwog...

James M. Johnson (jmjohnso@mtu.edu) wrote:

: My guesses why some people prefer the 800XL are 1) better keyboard.
: With each new machine, the keyboard became just a bit worse; the straight
: 800 had the best keyboard of any 8bit.

The 130XE keyboard is worse than the 800XL? I used to think the XL keyboard was alright, but I never considered it to be brilliant- the keys were slightly 'sticky' for my liking. The 130XE keyboard, although the keys are an odd shape, which doesn't really improve it (if you look, you'll see they're curved), feels slightly better to me. My 800XL is a newer one (I assume- the control and cursor keys have the writing in "inverse video" instead of the box round them which the earlier ones seemed to have), I'm not sure how old my XE is, since I got it second hand last year- maybe the different keyboards feel quite different on different versions of the same model. You want a crappy keyboard? Try the C64- both versions (the original and the 64C) have really crap keyboards. Yuk!

: I owned a splitter, so it was no problem for me. I also installed the
: 1200XL function keys in a diamond pattern so I had one key cursor control
: (both the XL and XE lines' OS and keyboard decoder chips support the
: 1200XL function keys - Atari just didn't install them from the 600XL on).

I'd be interested to find out all the keys the 1200XL had which the other machines didn't- were the extra keys useful?

918. Help for Zorro?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-07 12:04:04 UTC
From: lelie@smail.srl.ford.com
Message-ID: <lelie.117.000C1162@smail.srl.ford.com>
Source record: 102755

My 8 year old is finally interested in games. Great, until she gets stuck. Then comes; "Daddy, how do I..." Does anyone remember some of the parts to finishing Zorro (which is a pretty good game)? We have;

Got the hankee, descended into the well, used the flower pot to raise the gate.Got the key and the beer bottle to get the fat 'bouncer'(ha) drunk, bounced off him to get onto the chandelier to raise the thing on the rope. How do you keep that thing to stay up so you can descend the ladder and get that thing down near the gate in the well???

We have also got the branding iron, heated it and used it on the bull, getting the horseshoe.
We have also used the trumpet and the tetter-totter to get to the boot. What is the boot for?

We have descended into the caticombs to get a bag of money. Do we need more than one?

The box says we release the prisoners. Where are they? How?

What is the hay pile for?

How do you lower the drawbridge to fight the sergent?

Thanks in advance.
Larry Elie

I think Darek Mihocka's code for the Atari ST version of XFORMER is still
around. I believe this is still the best emulator in existance. Check out
the typical ST archive sites - the source code is available for one of the
older versions.

By inspection, if you see an IC with the part number C014805, that is the GTIA. Also, most older machines had a little yellow or white sticker with a "G" on them to indicate that it is a GTIA machine.

Hope this helps....

Actually, the Kermit-65 character set is a bit improved over OmniCom's
version.

When used on an 80 column monitor (not a TV or color monitor), 80 columns
like K-65 and OmniCom do is indeed entirely readable.

I still prefer the XEP80, of course.

Must be a misprint someplace then .. standard speed 300 rpm is 200 ms MINIMUM to read one track ... to read 40 tracks would take a MINIMUM of 8 seconds ... allowing NO time for head movement. Adding say 25 ms track to track settling time would add a second to this. Though ... if it modified the mechanism to double the rotational speed ... perhaps.

Ok, perhaps the 4 seconds are bit hard to believe, but I know someone
has it, so I could ask him for the right speed :-).

No, it comes not from Australia, but from Germany: it's an improved
"Speedy" (I think, it's a bit better than a Happy), with 192K RAM, so
the complete disk is stored in the floppy drive! It was only produced
in a very small amount, because no normal user was willing to pay
about 200DM ($100-$150). Perhaps Klaus Peters (look in the vendorlist)
hast still some of these.

Bye,
Jochen

Hi All,

I'd be willing to answer any questions concerning the files QWK8NEW.COM and QWK8.COM which I recently uploaded to Genie, and which are also available locally at 216-376-0885 (Rubber City BBS). This file(s) is/are an offline reader for the unexpanded atari 8-bit. I've had no luck getting QWK silver to run, and can't use PabQWK, so I wrote my own offline reader in C (AceC and CC8). Its all free, if anyone wants the source code they can have that too. I'd be interested in any problems with it that need corrected. Thanks.

Bob Stout

From: cwoods@genesis.nred.ma.us
Message-ID: <CMBsos.B7B@genesis.nred.ma.us>
Source record: 102760

Hi all! I am in dir need of the source code for K65 v3.7, if it is PD and available. This is to aid in the development of FlickerTerm80. Actually, all we need is a list of vt100 character codes ASCII counterparts. FlickerTerm80 is in Alpha test mode now, and one of the testers has requested this information.
Any ideas/pointers would be appreciated!
TIA...

-Chris

GF> versions of the same model. You want a crappy keyboard? Try the C64- both
GF> versions (the original and the 64C) have really crap keyboards. Yuk!

Hey, the C-64 Keyboards wern't that bad. Not when they were new anyways. They did tend to have a high degree of failur thou with commonly used keys. I think that was because of the size of the carbonized rubber contacts used. They were huge. Tended to streach out. I'd be willing to bet, if you find any used C64 owned by a person not afraid to open their computer, you'll find all kinds of crap wedged behind the key contacts. This of course also applies to the VIC-20 and C-16 computers as well. I do not think that the SX64 had this problem.

The C128 has a pretty good keyboard. Later model keyboards (I belive Hong Kong keyboards) seemed to be the best thou. Had a nice feel. C-128 keyboards wern't really effected by streached out contacts because it uses a very small pad. Only problem C-128 keyboards ever have is dirty contacts.

Source record: 102773

I have developed the following programs over the last couple
years, and if there is sufficient interest in any of them
I may look for a way to get them into distribution (as PD or shareware)

K-ASM - has all the features and psuedo ops of Atari Macro
Assembler (except VFD and USE). Has string passing to macros,
and even sub-parameters.
Generates standard atari binary files as well as a relocatable
mode compatable with the CC65 C languages assembler.
About 200% faster than AMAC and 5 or more times faster than RA65
(used with CC65).
There is also a linker although it is not completely polished as
the Assembler. I have been
using it for years over AMAC

Atari-Writer Plus Super Menu - requires 128K when used with
the 48K version and 256K when working with XE version.
It resides in a free memory bank and is called when pressing
HELP, gives TEXTPRO style directory menu, you can load a file
by simply pressing control-L.
It also has keyboard macros. AW+ does not even need to be
patched, it works entirely outside the AW+ program (unless you
want the ability to use the console keys from within a macro.)
Unfortunately, my memory expansion just died, and it will take
a couple weeks to fix (I currently am restricted to 64k :(

All for now, just seeing if anyone would be interested
in this stuff. All programs are 100% ML. Unfortunately,
it is a long distance call for me to access this group or
I could be more active

I have been told that your signature is -- in fact -- not anonymous,
and that the actual quote is:

"Time flies like an arrrow. Fruit flies like a banana."

...and was spoken by the immortal Groucho Marx as an aside in one of
the Marx Brothers movies. (I don't know which one, sorry!) This would
mean that the quote is attributtable to his script writer (named Kaufman?),
who was a famous comedy writer on Broadway in the 1920's.

From: poehland%phvax.dnet@sb.com
Message-ID: <9403082203.AA04059@phinet.smithkline.com>
Source record: 102784

Someone asked about availability of the 130XE & prices.
B&C ComputerVisions is selling new ones for $175 boxed.

I got one last year & regret it. Oh yeah, the PACKAGING & manuals & manuals & stuff was all new. But recently when I was working up the material for AC's special video issue I had occasion to pop the cover & see what was under the hood.

I was totally bummed out. The motherboard was filthy. Datecodes indicated it was an older model, vintage 1985, REV 2 or 3 or whatever. Handling the board grssed me out, it was so dirty. I had to vaccuum it off to keep it from soling my hands. Then I noticed a couple chips had been rerplaced on this board. Whoever did the work was a gorilla, it was a sloppy job. The datecode on the box was August 1991, corresponding to Atari's final production run of XE's for the "exchange market" (verfied personally by Bob Brodie).

It is now clear there never was a "production run". All Atari did was take a bunch of returned/malfunctioning XE motherboards that had collected dust in the warehouse, repaired them, repackaged them, & sent them on their way.

I also bought an Xe used from Dave Aronson who advertises heavily in the Swap section of Atari Classics. It was in MUCH better condition! And only $45 or so. No fancy box (like, who cares?).

'Nuff said?

954. 130XE vs XL

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-08 22:53:34 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9403082216.AA04543@phinet.smithkline.com>
Source record: 102785

Tim wanted to know why the XL seems more popular than the XE.
I still have two 130XE's & seldom use them. I got 7 800XLs & 4 600XLs & pound the hell out of 'em.

I also had a 65XE. Utterly worthless, I'm glad I sold it.

Here's my list of preferences for the 800XL over any of the XE's:

1.) the cart slot on the XL is in a convenient place, allows you stack carts to the ceiling if you want, & you can SEE exactly which carts you got in there. But in the XE the damn cart port is in the back where you can't see it, you fumble all round plugging in the cart & sometimes get your hands tangled in all those @#$%&*!!! wires back there & accidentally loosen cables, plus you can't stick a whole stack of carts in because they have to lie sideways, it's unwieldy, & you may not have the desk space.
2.) Some peripherals don't work as reliably with the XE as the XL. Not sure why. But I'm not the only one who's observed it. It has driven Bob Puff crazy. SIO & PBI both.
3.) The case of the XE is flimsy. Just doesn't have as solid a feel as the XL.
4.) The XE keyboard sucks. Mushy. Although, it is said to be greatly improved by adding the "TT-Touch" from Best Electronics. This is a bag of little rubbery cup-like things you plant under the keys.
5.) Some XE keys fail due to insufficient current. AC published a fix, I think in the Oct. '93 issue.
6.) The XE keyboard isn't fastened down. It just sort of sits in there on top of the circuit board. Man, what a sloppy way to do things. Low-class!
7.) The XE is dumb/dull/boring grey color. While the XLs have distinctive styling with their silver keys & brown/cream-white motif. Gawd, I think the XL is downright handsome. Sexy even. Not that I'm biased or anything. The case on the XL is made of heavy-duty Nomex, which is a lot more rugged than the cheapie styrene-based crap the XE case is made of. The XL case is thicker & heavier, & overall the 800XL is slightly larger than the XE.
8.) There's a little more room inside the XL than the XE for installing hacks & mods, if you're inclined to that sort of thing (I am!).
9.) I'll take a 600XL over a 65XE any day. The 600XL's deficient video is readily upgradable (see the December '93 Atari Classics). It's 16K of RAM is easy to upgrade to 64K. BUT... the 600XL has a PBI & the 65XE doesn't, makes the 600XL a serious computer. Once you see a little S-V/64K upgraded 600XL booting up a 20-meg hard drive it's really a kick! (I'm looking at 256K in the 600XL: "Thunder In A Pint-Sized Package"!). Of course the 600XL has the same handsome styling of the XL line, while the 65XE is still that flimsy boring grey whatever thing. The 600XL has been sadly neglected.

These are just a few things I came up with off the top of my head, I'd have no difficulty doubling this list if I really sat down & thought on it serious-like.

Chris Woods mentioned KERMIT-65 v3.7 "has the same 3-bit graphics characters as Omnicom".

NO! NOT TRUE!

Omnicom DOES have the same character set as VT-10-SQUARED. But Dunning's KERMIT has a totally different charcter set that is FAR more readable! (well ok, both sets might be 3-bit, but that has no direct relation to readability). I find K-65 v3.7 to be one of the best 80-column software emulators I've ever seen & am sorry John Dunning never really got the thanks he deserved.

Well, he's getting his kudos in the February AC (delayed, but now at the printer). Better late than never.....

Mike Hohman says Claus Bucholz did an 80-column cart for the ATR8000.

I wasn't aware of that. Velly intelestink. I got an ATR8500 around the house somewhere (the final incarnation of the ATR8000). It had places on the board to plug in something, I always wondered what.

I'd like to see the 80-column thingie for the MIO. I enquired of ICD about it once, they said they had developed such a beast but didn't release it due to poor sales of the MIO but would would be gald to seell me rights to it for under a million bucks.

I ran away FAST.

Be nice if FTE could sell that thing. <hint, hint>

As a hard drive interface the MIO sucks, but as a plug-in RAMdisk & serial/parallel port it's decent. Add the 80-column video (& software fixes for things like ATW-80, Turbo-Word & Turbo-File), & it might be useful again.... IMHO.

Mike, yah I know Sparta rights have changed hands, & that I probably would have a much easier time of it today than I did last year-- as far as SpartaDOS is concerned.

But in fact the Sparta thing was only one among MANY problems I encountered dealing with MicroMiser. I sent the man two well-written 5-page contracts, both of them based on agreements we reached first on the phone-- & the guy turned BOTH of them into chop suey. The first contract was immediately voided because the gut didn't even have the decency to give me his legal name: yup, I wrote up a contract to do business with a dude who was using a fictitious name. Among other stuff.

How many hours on the phone, how many precious weekends were wasted? After that experience I knew I didn't belong anywhere NEAR the Atari vendor/developer comunity. My style is just too different. I met Tom Harker several times & THOUGHT I carried on conversations with him, or was he looking at the person behind me? Or that fly on the ceiling? Or was that blank stare just his usual way of looking at people? In all of my dealings with these folks, I just never seemed to connect or whatever.

Ben,

ICD did develop a COLOR 80 column (based on IBM CGA I think) option for the MIO.
My early production one megger even had the 9 pin port labled video (of
course it didn't do anything - but it was there just waiting).

The reason ICD never marketed the product was Atari (read Tramel) kept changing
the technical specs for their monochrome 80 column box. ICD knew it had to be
software compatible with Atari's 80 column product.

By the way, the reason the MIO didn't sell had nothing to do with lack of
demand. Right after the MIO was introduced, the US government slapped a HEAVY
tariff on imported 256K DRAM chips. The cost to build the MIO skyrocketed
and ICD couldn't sell any at that price, so they stopped building them.
When the price finally fell, ICD had decided to stop making them continuously
any waited until they had a large backlog of orders. Users didn't want to
order one with no idea when the product would finally arrive. I knew people
who jumped at the chance to buy a one megger whenever ICD would build them.

I'd just like to say thank you. The Atari community needs more real
programmers like yourself.

People, if you need something and the Atari community needs it as well,
and you can program it or already have, don't hesitate to share it with
others because "shareware doesn't work anymore, I won't make any money"
or "it's not compatible with GIF89a/ZIP 2.04"...

Something to ponder: A mod to the standard Commode-drive allowed users to copy standard disks in 15 seconds, protected in 21 seconds... BUT the mods only applied to disk copying - load/save time in trying to actually RUN or USE software on the disk had to use the normal sloth-aspiring I/O rate!

If the 1541 (or whatever the number was), with mods, could copy a disk in 15 seconds flat (35 tracks, double density), an Atari drive with proper mods should at least approach if not EXCEED this rate!!!

>7.) The XE is dumb/dull/boring grey color. While the XLs have distinctive

I don't know if you count the XEGS as a true computer or not, but as far
as it goes I have to disagree with you on point 7. I think it's the
handsomest machine I have by far. I love the pastel colouring and the
big round shape of the START/SELECT/... keys, and the 45 degree angle
of the cartridge slot is a beautiful touch. The only thing I don't care
for is the way the joystick ports are recessed and at an angle. Makes it
very hard to get the plug in smoothly.

>2.) Some peripherals don't work as reliably with the XE as the XL. Not sure
> why. But I'm not the only one who's observed it. It has driven Bob Puff
> crazy. SIO & PBI both.

Do you have sound problems with your XEs when you have a 1050 connected?
With mine as soon as I plug my 1050 into the SIO, the
sound level drops to a hush. It sounds like it's not being amplified.
Drives me nuts.

Has anyone got any new info on the PC Xformer 3.0 that Darek Mihoka was working on. I'd like to know what is the minimum amt. of RAM I need in my PC, speed required for 100% emulation. Pariphrials (sp?) supported. Where to get, and price. I'd also like to state I can get an 8-bit fro $20 and an SIO2PC for $50 (I have both anyhow, so I was showing the ballpark figure of what the emulator is worth). I'd be willing to pay $20 for a good workable version.
Am I the only one who gives a damn about seeing a fully functional 8-bit emulator for PC's, or am I really holding on to a dead dream?

Well, if it says MYDOS disks then it doesn't necessarely mean you need MYDOS
in order to read a disk. In the beginning I've been using DOS 2.0D
(where the 'D' stands for double density) without problems.
I'm almost sure you can try reading these disks with any DOS that
supports real DD.

Maybe you should try a few things to get your board turned around. There are _SINCERE_ suggestions and just may help you.

1. you have a _SERIOUS_ problem with upload/download ratios!! Quit being so _CHEAP_ with your files!! We as Atari users have a hard enough time getting files and support for our computers to want to deal with a bbs that is so tight with it's files.

2. I've sent you an incredible amount of e-mail about your ratio problem (I sent you around 15 files, but was only able to get 8 in return). you never once answered any of my e-mail.

3. The amount of time you get to users who call, SUCX!! Why would I waste money calling a system l/d that only gives 45 minutes per call?? That is NUTS!!!

All of the things I mentioned above is why I stopped calling your bbs, and if it is that easy for me (actually, most of the money I spent calling your system was just in trying to get my access problems straightened out), it is just as easy for others.

Amos Jackson

I've sent you some net-mail on this, but am not sure if you will get it or not so I'll also post it here, since you placed a statement "if anyone is interested".

First, I can't tell anyone how to run a bbs, for all SysOps make their own rules, but as a SysOp, I can give some _SINCERE_ suggestions to you that just may turn things around for you. Please keep in mind two things: 1. What I'm about to post is _MY_ experience on your system, 2. All suggestions are _SINCERE_ in nature. As another PRO SysOp, it would be nice to see you stay online.
Here goes:

1. As a l/d caller, 45 minutes per call to try to go through the 350 megs of items you have online just does not work. We as Atari 8-bit users have enough of a hard time trying to find good support for our equipment, and being cut off because of small allotment of time online, for me is just not worth a long distance call.

2. I also had a problem with u/l-d/l ratios on your system. I found that I had a 15 to 1 ratio. I sent you 15 files between 2 or three calls. Quick math (off the top of my head) tells me that I should have been able to d/l 225 files (not that it would be worth it to have to make the amount of l/d calls with the severe lack of time given), yet I was only able to d/l about 10 files before being told I needed to u/l more files.

3. In reference to the above problem with u/l-d/l ratios, I've sent you numerous amounts of feedback, and never once got a reply. The mail referenced the u/l-d/l problem, and also the time limit problem, and the fact that I was calling l/d. Usually no responding message from a SysOp who was sent feedback gives the impression that the SysOp is not interested in the user.

The above reasons is why I stopped calling your board.

As stated at the beginning, these are very real problems I've encountered on your system. Maybe if you relaxed access to users, your system would become more enjoyable to users such as myself. You cannot honestly expect users to keep calling when your only allowing 45 minutes per call and small u/l-d/l ratios. It's just too rigid! Hopefully, you'll see my post as an attempt to point out some important items that need to be addressed in an attempt to save your system and bring what is otherwise save a good system, rather than someone out here trying to knock how you run things.

Keep the faith!!

willing to give us a few pointers, PLEASE POST to this newsgroup if you can...
I'm sure there's a few others playing this old Datasoft favorite that are
afraid to speak up (or can't post)!!!

Ooo, Zorro :) I remember playing that (on a friend's C64, no less).
You need to get ALL the bags of gold from the underground caverns. To
get through the maze, always take the nearest exit to the gold, and
once you get to the exit (with the three objects on it... Boot,
bottle and glass?), you have to take the top left exit and push the
barrels, go back and through the exit.

Dunno if this is right, but I *think* so. Anyone have a Zorro on disk
they'd be willing to part with, so I can check? :)

I prefer omnicom for the assignable keys... and macros... nice to have a macro to do an "atdt<phone#>" and another to do a login.... but its only kermit is 8 bit kermit (and on the net, I sometimes need seven bit, so then I use Kermit)... one other thing, the net does not really support XON/XOFF, so I had to edit OmniCom to kill it (in Kermit you can set if off)... one problem with Kermit is accidentally pressing the break key... I believe I posted in this usenet group short ML: programme to kill the break key (run before Kermit).

You don't need mydos.... need double density in mydos (atari type dos) format... if you have sparta dos.... do an ainit in double density format (NOT XINIT). NOTE: I think one of them (programmes to read double dens. ainit formats) says it can transfer binary files.... it seems to handle control characters ok (non ascii), but still seems to convert any $9B=155 decimal to $0D,$0A (in atari to IBM... have not tried it the other way).

I have an old 800 with a rather peculiar problem.. It was not working when I got it in the mail so I took it all apart and started pushing chips back down into their sockets.. Every chip I pushed *snapped* and *crackled* back into place.. I put the thing all back together ad it worked great (or so I thought). It seems to work fine until you start drawing large text on the screen.. The letters are inverted... All the letters are upside down! Now it doesnt do this all teh time, just occassionally.. Like when I play mule (my primary purpose for getting the 800).. If anyone has any ideas about this please please let me know!! Thanks..

978. Re: Atari 2600 Driving Controller info wanted

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-09 17:40:35 UTC
From: rkim@jupiter.uucp
Message-ID: <2ll1mj$p8u@nic-nac.CSU.net>
Source record: 102659
Cross-posted to: rec.games.video.classic,comp.sys.atari.8bit

I've noticed people have inquired about Atari's Driving controllers so here's
some info on programming them taken from the OS manual...

_________O/______Snip here_________________
O\

Driving Controllers

The driving controller has no positional stops and thus allows unlimited
rotation in either direction; the output of the controller is a 2-bit
Gray code which can be used to determine the direction of rotation.
The controller is sensed using the same internal hardware as the
joystick, thus the same data base variables are used for both.

J8 STICK0 - STICK3 [$0278,4] -- Driving controller sense

The 4 driving controller sense variables contain an encoded
rotation (position) sense value, as shown below:

```
7 6 5 4 3 2 1 0
+-+-+-+-+-+-+-+-+
|0 0 0 0 1 1|val|
+-+-+-+-+-+-+-+-+
```

where a clockwise rotation of the controller produces the following
continuous sequence of four values (shown in hexadecimal):

0F,0D,0C,0E,0F,0D,......

and a counterclockwise rotation of the controller produces the
following continuous sequence of four values:

0F,0E,0C,0D,0F,0E,......

J9 STRIG0 - STRIG3 [$0284,4] -- Driving trigger sense

The four driving trigger sense variables each contain a single bit
indicating the position of the driving trigger as shown below:

```
7 6 5 4 3 2 1 0
+-+-+-+-+-+-+-+-+
|0 0 0 0 0 0 0|T|
+-+-+-+-+-+-+-+-+
```

where: T = 0 indicates trigger pressed.

-------[Operating System C016555 -- Appendix L]------

Enjoy,

rkim@jupiter.calstatela.edu

Other cartridges-

Atari 7800- One-On-One
Atari 5200- Pac-Man

==========
For the TI -99/4a I have the following to trade/sell:
Hardware-
Cassette recorder/player and cassette interface cable-
Dual or single cassette interface cable
TI-joysticks (a pair)
Adapter for using Atari/Commodore style joysticks for the TI-99/4A
High-quality game joystick, 2 fire buttons, stick has hand shaped contour

Joystick/Cassette extension cable- 10 ft, new.
Super Sketch (graphic table with software, connects through the cartridge slot)
The main TI-99/4A computer:
TI-99/4A console manuals, RF-modulator (T.V. cable), power supply,
all parts included.
Dust cover for TI-99/4A (generic)
color monitor- composite color video, and audio. Also useful for Atari, Vic-20,
Apple, older PC's and other computers, Nintendo, Sega, VCR, etc.

Game Cartridges- (also have a lot of educational cartridges, please ask
for a list if interested):
Super Sketch (graphic table with software, connects through the cartridge slot)
Honey Hunt
Soundtrack Trolley
Space Bandits
Meteor Belt
SuperFly
Video Chess
Othello
A-MAZ-ING
Hangman
Mind Challengers/Video Games II

982. F keys on XE

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-09 18:49:29 UTC
From: lmurdock@austin.onu.edu
Message-ID: <1994Mar9.184929.76718@austin.onu.edu>
Source record: 102663

I thougt I read somewhere that you could modify an XE to bring out the Extended function keys of the 1200XL. Supposedly the pins are still there to support them, they were just never brought out to the surface.

Does anyone know about this. I always wanted those keys on my XE, (and 800XL!) It would require you to mount 4 switches on your case somewhere, but I can handle that...

It would be great to have DMA on/off and keyboard lock on an XE.

Thanks
Lance "Ate_bit" Murdock

Writing a basic/machine (usr call) program to take a binary executable file on an atari from disk and write it to a 410 tape as a bootable tape. Then taking said tape home and booting from the 410 to play star raiders, 'cause you don't have a disk drive yet. Oh, man how fun a game can be when you must go through so much trouble to get it to run at home.

>Eric

Actually, I'd love to see the emulator, but if I had $20, I'd get one of
these drives fixed. Maybe both if I trade in my XEGS... heh. (Got an
800xl)...

A SIO2PC for $50? It costs THAT much? you can get your own bloody drive
for that much. That would make the emulator that much more necessary!

l >it'll sell big...

PC Xformer will be a commerical product, I really doubt that you will see
it released to shareware anytime in the near future.

From what I've read to date about PC-Xformer, it's the emulator folks seem
to be waiting for. Currently, it uses disk immags created using the
ST-Xformer cable on the ST, however as I understand it, any sector for sector
disk immage file should work...this means that disk immages created using
SIO2PC should work as well (with maybe a little mod. i.e. removing the SIO2PC
header information).

g >I'd be interested to find out all the keys the 1200XL had which the other
g >machines didn't- were the extra keys useful?

I've used most of the 8bit line at one time or another, the keyboard on
the 800, to me, was one of the best. However, the very best keybord I'Ve
ever used is the IBM keybord I've got hooked up to my 130 right now through
the TransKey.

Not only do you get a good key response, solid feel and freedom to move
around but you get the Fkeys (found on the 1200, 1400 and 1450xld) plust
a keyboard buffer, macros and a great 10 key pad built right in.

Not quite the same three bit font as Omnicom, but close. Its just my opinion but I find the text produced by K65 far easer to read than that of Omnicom...but thats just me. Now, Omnicom does have built in software flow control...this allows it to keep up at 2400 w/o losing a character and both K65 and Omnicom support a Vt100 keyboard layout. I just find that for most of my 80 col needs K65 fills the bill.

To be fair though, I swap both of 'em out for BobTerm when I've got to transfer files...Ymodem batch can really make live easy...

c >I may look for a way to get them into distribution (as PD or shareware)

I know you'll hear this many times, both in the net and in E-mail but
please do upload your files somewhere, either the archive at Umich or
to an Atari board (if you have one) local to you so that others cann
call and try out what you've written.

You really won't see much in the way of shareware fees, but there will
be several folk who will kick something in...Nick Kennedy is still getting
folks sending him SW fees...enough that he's started working on the next
upgrade to SIO2PC (Yeah, I spoke to him not that long ago).

Take care

I agree...tank ghod for the ICD adapter board...

p >2.) Some peripherals don't work as reliably with the XE as the XL. Not sure
p > why. But I'm not the only one who's observed it. It has driven Bob Puff
p > crazy. SIO & PBI both.

I've got 3 130's and 6 800xl's, only one 130 fully works with the BB, and each
of 'em has the SIO and PBI connedted just a little bit differently from one r
another. All the 800xl's work w/o a hitch...

The main thing the 800xl has over the 130 is the ease of upgrade... every
thing in all my 800xl's is socketed. Adding a TransKey, extra memory or
the new color genlock device is snap...well, far easer than on a 130.

Are there any Atari 8-bit Emulators available for the PC? I did come across one from Germany that sounded ok but I couldn't really get it to work (and the docs mentioned that it didn't support player missile graphics).

Please email as I don't normally read this group (even though I still love the atari 8-bit!)

Thanx...

> 1) When putting drives into the high speed, warp speed mode like the 1050 can
> do; is this a command sent to the drive? If so, what is it and what
> response is it looking for?

Apparently, this seems to vary depending upon the drive and DOS. Indus's SynchroMesh mode is not compatible with US Doubled 1050's UltraSpeed mode is not compatible with XF551's high speed mode. DOS XL is the only DOS I know of that supports the GT's mode (I think there MIGHT be a patch for SpartaDOS X), and I have not had any luck in finding anyone who knows any of the tech info on SyncroMesh. Several DOS's support the UltraSpeed. DOS XE and SpartaX support (I think) the XF551's high speed mode.

> 2) On a format command, a bad sector list is sent back, if any exist, but
> MYDOS 4.5 doesn't allow bad sectors. On a floppy you would just throw out
> the disk, but on a hard drive you can't do that. :)
> So do I need to lie and say all is well and then have a seperate program on
> the Atari to analyze all the sectors and map out the (if any) bad sectors?

The normal way this is handled (except for IDE drives! <g>) is to have an external program "low level" format the drive and map out bad sectors before the DOS actually tries to "high level" format it (put DOS'ly type stuff on it). I have also heard that IDE's are already low-level formatted, so this might not work. You might extend this concept to have an external program do a format of the drive, and then mark bad sectors as used in the VTOC. You should also try to make your drive and program compatible with SpartaDOS (3.2 and maybe even X) so that a wider variety of people could use it.

> 3) Does such a program exist for the parallel port drives that could be made
> to work on my serial port?

Well, I have several programs to "low-level" format different types of drives on my K-P Hard Drive interface (Supra), but again, the IDE thing is the unknown factor. I don't think that anyone has tried to adapt an IDE drive to an 8-bit (unless Bob Wooley did it <g>).

> 5) Last of all - is anyone else interested in such a project?

This would be very interesting if you could make it work. Especially if it was generic enough so that larger drives could be used.

Thanks! Now, does this thing also have some info about the trackball? I called Atari and spoke to technical support, the guy had no idea about how it worked or where I could find info. I mentioned that an old APX catalog mentioned that they had the information available to anyone who wanted it. He kindly informed me that APX was no more and that they were separate from Atari (both of which I knew, and was just trying to point out that the info had to exist). ARGH!!!

>keyboard with a cartridge port on top (and a PBI in back)...
> ... if only we could stuff a modem in there too... :)

I have always seemed to start too small and have to expand. I still have
my original 400 that was expanded to 48K and had a real keyboard added.
In some ways it was my favorite 8bit Atari computer. I also have
my 600XL that had the video upgraded. This was easy because the paths,
holes, etc were already there. I just had to copy the circuit from a
800XL and drill a hole in the case for the jack.

The memory was a bit more of a problem. The one I used was actually
designed by another engineer here at Bell Labs. We burned our own
PAL devices and added 256K of memory. Problem was that we could never
figure out how to get enough address lines for bank switching and so
we ended up with machines that have 256K of memory but only have 192K
accessable. Just never did figure out how to access the last 64K.
Worked pretty good though and came in handy as a good size ramdisk.

>version.
>Am I the only one who gives a damn about seeing a fully functional 8-bit
>emulator for PC's, or am I really holding on to a dead dream?

Darek posted the specs here recently. I have a printed copy, but I dumped
the file or I would email it to you.

A good emulator is worth quit a bit to me. I would not balk at paying
$80 - $100 because I have a lot of PD software that I would love to run
again. I don't think it would be possible to run copy protected software
because most had to be booted as I recall. I would love to have a cracked
copy of all the games I have the original disks for, but that is inviting
abuse and has been beaten to death here.

Course this leaves out the ability to use cartridge games, but I don't
mind pulling out the old 8bit and hooking it to the TV so we can play
those games. It's just that I don't have the room to set up my 8bit
permanently and having a good emulator would be a god sent. If you're
holding on to a dead dream, then so am I.

Mark Perry (mperry@cairo.anu.edu.au) wrote:

: What you are thinking of is SuperMax which I have in my 1050. This gives
: you UltraSpeed I think (38000 baud??).

All right! A user of Paul Nicholls Atari 8-bit upgrades!!! This is what I've been waiting for... a first-person review (well, maybe you could fill me in a LITTLE bit) on some of the "Super Products" items!

1. Is Paul still producing (or does he have an inventory) of old Atari 8-bit products? Has someone else taking over Super Products?

2. I have an old address for him in Beenleigh, what is his current address?

3. Does he have a catalog?

4. Super Max is an "enhancement for the 1050 drive"... that's all I have to go on. Is it a "doubler"? Does it provide single/enhanced/double support? Is it a "super-mod", something like a Happy or a Duplicator that allows you to back up heavily copy-protected disks (I have a few I NEED backups of before it's too late!)? The high speed mode you mention, is it compatible with the ultraspeed skew (US DOUBLER)? What DOS takes advantage of it?

5. Do you use SUPER-DOS? Is it really as good as it sounds? Good ramdisk support? Is ramdisk splitting (2 90k ramdrives instead of a 192k for instance) available? I've heard it's much more compatible with DOS 2.0 and 2.5 than MY-DOS... any problems that you've encountered? Any way to read Sparta-Dos disks/data?

6. What other products are available?

Thanks,
-Tim

PS: PLEASE let me know what you can in regards to the Super Products line... no one on the net has heard of it but me it seems... :(
(I was going to get a letter out tomorrow evening, but will wait a bit to see if my address is current, and to see if Phil's still in business!)

This is definately true. If your machine worked at all, consider yourself
lucky...

Atari sold off the Taiwan production facility that made the 8 bits long
before that supposed 'production run' took place. They didn't even have
the ability to make them if they had wanted to.

The fastest I have seen previously, was Dave Small's LE interface, which can format and copy 7 disks in 17 seconds. While it would be fun to call that 2.4 seconds per disk, it did them all at the same time. So if you had only two drives, it would make 1 disk in 17 seconds.

Re: Pc disk reader...

Well, not having a modem on the Atari leaves out the easist way, that being a null modem connection. You could still try getting Util (from the archives) but you didn't say if your 1050 was double dens or not. Other than that, the only other ways to do it would be to use the MULE program (kinda slow but it works) or get an SIO2PC...

Using MULE you can move one program per disk between the 8bit and the PC...If I recall right, the size of the program to transfer is limited to 32k.

With the SIO2PC, you just need to set your
Atari up next to your PC, connect the SIO2PC cable and your done.

If you have double dens drives and need a copy of MyDos, drop me your address in E-mail and I'll send you a disk ..Also one with Util (the PC to Atari transfer utility...)

Re: AnsiTerm...

No, the three bit font for K65 had been around long before AnsiTerm showed up...infact, Robert may have used K65 as the base for his font...though I still feel K65 is far more readalbe and the font in AnsiTerm is far from complete...notice the fact that the graphic characters fail to line up...

I've never really used AnsiTerm that much, there's a bug in its Xmodem that can lock up boards (I know because I've done it...) and without hardware flow control, the best you can get is 1200 bd... even with flow control, and the program set to 9600, the best throu hput you get is 2400.

>I have a better-than-average OMTI? <grin>

Well, the current limit per partition on the 8bit is 16meg.. However, if
the next version of MyDos is ever finished, we'll be looking at 48meg per
partition. I'll come clean on one thing though, I've several OMTI's and use
one of them on my IBM at the office...it craps out on partitions above
20 meg...

So, the OMTI does work with the 8bit and BlackBox and partitions less than
20 meg...not hard to do when you're limited to 16 meg per partition.

tl> Thought this was due to wear! Hmm... the fix did mention replacing a
tl>resistor though... did the keys fail over time then? (After a couple years or
tl>so of use)?

No, if you take a look at the ribbon connecting the keyboard to the mother board, you'll notice on some systems that the screened on conductors are blackened...This same thing happens with the connection to the Start/Select/ Option/Reset keys. On two of the 130's I've got setting here, you can see what looks like heat discoloring on the connector

True, ware has a lot to do with keyboard ding, but I've seen many more go down due the above problem...that and heavy smoking around the computer to the point where the whole thing turned yellow...but that's another story, one that should be on Tales From the Crypt...

tl>out Ansiterm v.1.0 on the umich archive to see what I mean... IF ANYONE HAS AN
tl>UPDATED VERSION OF ANSITERM OR KNOWS THE AUTHOR'S EMAIL ADDRESS, PLEASE POST

K65 V3.x was out long before AnsiTerm. It's possible that Robert may have
looked at K65 to develop the look for his font. Still, the font in AnsiTerm
is far from finished as the mis-matches with the ANSI graphics will attest.

I've used several versions of AnsiTerm and the only way to get any throughput
out of it, i.e. 2400, is with hardware flow control...a BlackBox. With
anything else, you're limited to just 1200.

tl> (For that matter, off the record, will FLICKERTERM support ANSI emulation?

Ansi graphic support is there now and still being improved, as well as
VT100 support. The current Alpha test version supports 9600 without
character loss.

That's kinda weird. Which version of K65 are you using? I never had any
problems with the break key, either on the 800 or on the 130XE. It's
disabled here, and I didn't have to hack.

Brights would be cool, but not necessary. Perhaps the inverse could
be implemented in the same sense by highlighting the foreground.

I'm not trying to take any credit or anything, but I came up with the idea
shortly after, at the same time, or possibly before he did and wrote a
small program which used the technique. I didn't know he had the same idea.
It's so easy, it's a sin. I programmed the interrupt in an ML string
and the display routines in BASIC.

> It makes sense since he wrote CVSQUASH and CSVIEW, the colrview

I call the same board he does. Perhaps I can convince him to subscribe
to the Internet. Having said all this, I'll forward ourcomments to him
so he knows what we're thinking.

The magazine you need is ANTIC, Nov. 1985.
There is a basic program that ouputs machine code.
(also, the assembly source code is provided)
It includes plans for a simple interface that you need
to build.
Supposedly, the program converts Morse code at any speed
between 5 and 70 words per minute.
Without the interface, it is capable of being used for
code practice via a joystick, or by connecting a code key
to the joystick port.

Perhaps you should ask some of my users how I gave out file access and online time.

My average download ratio was 50:1 and I granted their first upload free, so they could get 50 downloads right off the bat.

I also granted everyone 90min/call.

YOU were the only one I excluded because you were such a butthead to me on YOUR BBS - hence I returned your two month delay in giving me ANY access on your BBS by giving you MINIMAL access on my BBS.

Enough said on this topic.

Second reply (and final) to you on this subject

Dont preach to me about running BBS systems, as mine was online over 9 years nonstop.. Can you say the same about your system?

Please dont act like the God of BBS's and you'd only be kidding yourself.

If you wouldnt have waited over 2 months to give me ANY access on your BBS, I wouldnt have jerked you around on mine, by not giving you unlimited DL, and unlimited time and replying to your mail, etc..

I did those things to YOU ONLY as you were such a butthead.

Hello!

I have a friend in need of some information regarding printers with Atari 8-bit computers. He needs to know if it is possible to use a 24-pin dot-matrix printer with his system (I beleive it is an XL). He wants to use it with some graphics programs. Also, is it possible to take advantage of the 24-pin capabilities with these graphics programs, and which ones are available which do?

Thanks!

All this discussion of OMTI controllers is nice, and I am not familiar
with them specifically myself, but doesn't it occur to anyone else that
perhaps there is more than one model of OMTI controller being discussed
here? Noone mentioned any specific model numbers.

Two things occur to me right off the bat. Different models with perhaps
one being configurable for different size sectors, perhaps another allowing
larger partition sizes on the raw disk drive. Or perhaps jumper configuration
with some people having lack of complete documentation as too how they might
be changed to support different size sectoring (never any substitue for
complete documentation, or as complete as possible .. and quickly, before
the companies envolved go out of business <grin>)

Then there is the sector addressing limits of the operating system, but
that is a different problem, with different possible solutions (for example,
partitioning in the software).

As the folk I know up in PA say, Yeper... the controler we first started
talking about was the OMTI 3527a, ones that ICD were dumping on the market
just before they sold the rights to the 8bit line to FTe. But you are right,
Jim and I may be talking about two different models of OMTI... Now that
I look at the book, I wonder what would happen if I hooked a 7200 (supporting
ESDI) up to the BB...says here its a SCSI to ESDI...Hmmm got several ESDI's
laying around....

: line . . . did the XE line have further enhanced graphics?

Significant? Nah... noticeable? Yes. Wondered how much better it
actually was so I bought a 1200xl way back when. Nice, I'll admit, but
the change in video from the 1200xl on forward influenced the sound
quality. No, no, nothing major, but my 800 will beat ANY of my other
XL's in the sound "fullness/richness" department. (Best way to hear
the difference: BOOT UP ALTERNATE REALITY: THE CITY AND ENTER SOME OF
THE DIFFERENT PUBS! THE SOUND... well, you'll find out! :))

Also, starting with the 1200xl, I/O was improved... how? I have NO
IDEA. But loading compressed files IS SIGNIFICANTLY FASTER on the XL's!
(Try out Crider's Compression System... compress your binaries and try
loading them (decompressing on the fly)... the 400/800's stutter a bit,
but even my 1200xl will keep reading from the disk consistently without
date trasnfer rate changes!)

Bad news, the first SAMS manual is a "programmer's manual" only.
A. T-V. used to sell hardware manuals, but didn't really make much
from them. Best place to find these is at a local library. (Mine
even recommended me making copies of them instead of buying them...
they run about $24.95 each from SAMS... and as long as it's for YOUR
personal use, it's PERFECTLY LEGAL, don't feel guilty.)

Well, I don't have this list either but I know of two formerly commercial
programs that have been released to the public (as SHAREWARE?).

First one is "Sereamis" and the second one is "Atlantis". Both are
graphics adventures with German text. Actually I've still got the original
copy of "Sereamis". I think I've payed around $50 for it way back in 1985.

Both titles had been sold under the label of AXIS, a trademark or contracted
company of ARIOLASOFT.

Both games can be found in various PD libraries. An interesting fact
is that only the games itself are PD today. The intro is still
copyrighted and may not be distributed. Funny :)

With help form Brent Hoeffler & burzynas, we have to date: (spoilers!)
First, go down the well, jump on barrels to right lower screen, go down to next room and get flower pot, carry pot back up and use its' weight & yours to move bowling ball to raise gate (allowing later access to challice). Go out well, get hankee upon emerging.
Second, go right across next screen, then through bar to hotel. Get key, bounce on couch 3-4 times then up to right, down again, then right out to mission, climb mission to top, back to left, back into hotel, open door with key, jump across to get bottle, go down, go left into bar, give bottle to bartender, jump on bartenders' belly, up to left, fight guard forcing him to fall on chandelier (don't kill him). Go down ladder and get challice, re-emerging in bar.
Third, use key in hotel again as above to get branding iron in same location in hotel as bottle, this time go back to the second screen and climb the tree, jump to left, then go left. Go to middle of screen. Put iron on furnace, jump on bellows until red, pick up and go right to bull, then go up and around to get horseshoe.
Forth, use key as above to get bells (2, one at a time) and place in holes on top of mission.
Fifth, use key to get trumpet, go left, get on left side of teter-totter, blow trumpet. After guard jumps, you fly up, go to top and get boot.
Sixth, go into caticombs now open at mission. Go DIRECTLY TO GOLD bags, DRAW MAP! After 7 bags, you see the 3 item exit. Go out.
Seventh, free 6 prisoners, then climb on their backs to go to left. Go left to next screen, and again. If you get killed you will end up SOMEWHARE in the caticombs. Continue going up to left until you are out, then re-enter and USE YOUR MAP!
Eighth, give hankee to lady, she knocks me silly! I goofed somehow! I tried to push the drawbridge open, I couldn't. Did I need the key? What for? If I had the key and I get killed, doesn't it end up back at the hotel? How can you get the challice now, is the well acessible from the caticombs? Help?!?!?! Thanks. Larry Elie lelie@smail.srl.ford.com

You may still have a loose chip somewhere, maybe the Antic chip. There's an address you can poke that makes letters turn upside down. (looking in Mapping The Atari) POKE 755,4 turns characters upside down. If they are upside down, try poking 0 or 4 in there to see if they turn right side up.

1043. SIO-Protocol wanted..

I'am currently re-implementing an 1050-Emulator for the ST from an very old GFA-Basic-Source... I ran into problems, cause i do not know exactly the "protocol" of the SIO-bus. Can anyone help me out?? What follows after recieving a "Command Frame" (Device: '1'..'8', Command: 'S','R','W','P'.., LSB of Sector, MSB of Sector, Checksum) How do i calculate the checksum? If its too much to post or email, where can read about it?

Thanks, Kolja

Hi there.
I'm new to usenet and just thought I'd drop a note. I STILL have 2 Atari 800XL's, on with 256K ram. I also have a 1050, xf551, and a rana disk drives. Also, an Avatex 1200HC modem and of course tons and tons of software. I don't use it much anymore but am interested in talking about the systems and learning about where to get some software. Hope to talk with you all more!

=+=+=+

>recommend either of these books? Does the SAMS book apply to the 800XL?
>My specific interest is in pin-outs, board schematics, etc. All comments
>are appreciated.

I have the Atari XE User's Handbook, which is about the same as the XL
edition. I can tell you that's it's fairly nice, but certainly not
particularly technical. Probably at about the same level as the manual
that came with your 800XL.

1046. Gemulator + STXformer = Emulation on PC?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-11 19:07:09 UTC
From: goble@maxwell.ee.washington.edu
Message-ID: <2lqfgt$j3l@news.u.washington.edu>
Source record: 102626

First, I am not familiar with the Gemulator or the Atari ST (just 8-bits). If memory serves, "Gem" is the OS for the Atari ST. So is Gemulator an ST emulator for the PC?

From some previous posts, I got the impression that this Gemulator runs on a PC and that it could the run STXformer which I got the impression was an 8-bit emulator for the Gem OS.

Is this doable? If so, please provide me with more information if you can...thanx...

-Brian

As I understand it, Bouty Bob Strikes Back came out only on cart.
I would like to purchase this cart from anyone who is willing to sell
it. If it is still commercially available, then I'd appreciate some
pointers on where to get it. If it is not commercially available anymore
then would it be possible if someone made a disk file copy of the
cart?

I have some disks I created with US skew, and can read them with DOS XL in an Indus GT with Synchromesh, and with MyDOS in an XF551 (with CSS enhancement). The MyDOS/551 has the edge in a close race, in my experience.

Yes, it's possible. He'll need a printer interface, like the Atari 850,
the ICD P:R:Connection, the CSS Black Box, and various others.

|> wants to use it with some graphics programs. Also, is it possible to
|> take advantage of the 24-pin capabilities with these graphics programs,
|> and which ones are available which do?

I've seen only one program that used the 24-pin capabilities...for an
Epson printer that had an uploadable character set. It would allow you
to print MicroPainter files with correct intensity using that feature.

I have also written an unreleased program that can read and print out
TIFF files, to a 24-pin printer in 180 DPI modes. But most people have
never heard of TIFF files...

Of course you can always use the printer in Epson or IBM ProPrinter
emulation, for 9-pin printer programs (Daisy Dot, etc.).

The SAMS book you mention does not apply to the 800XL. It is a really thick volume, but for all its thickness does not cover the 400/800 all that well.

SAMS does publish (or did) the schematics for the 800XL as part of their PhotoFacts (ComputerFacts?) line. This *did* contain pin-outs, diagrams, parts list, and is very good (albeit with some errors that Ben Poehland and others have pointed out). They also tend to draw their transistors upside down and every which way. Anyone care to polish these up and release a machine-readable copy?

1051. WANTED: Atari SX212 modem with comm cartridge.

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-11 23:10:06 UTC
From: jleon@girtab.usc.edu
Message-ID: <2lqtoe$3te@girtab.usc.edu>
Source record: 102632

Hi, I'm looking for a 1200bps modem for my dad. It has to be plug and play
(my dad doesn't know how to deal with this stuff too much). I know the
SX212 can be plugged into the SIO directly and that it comes with a cartridge
with the comunication program so I thinks that is the way to go.
If you have one for sale or you know were can I buy one please let me know.

Thanks!

1052. Where Dem Aussies?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-12 00:17:09 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9403112356.AA02859@phinet.smithkline.com>
Source record: 102633

I noticed the post from Mark Perry with some interest.
AC has, I think, a grand total of 4 Australian subscribers. I think
Mark is one of them, the name looked familiar. Cool.
But he's right, we don't see many Aussies here. Really rare. Those guys
Down Under had a few neat products for the old 8-bit. Come to think of it,
no more New Zealanders either. Remember? We used to see post from those
guys. It was really neat to see posts from Classic Atari users Down Under.
Haven't seen Dawn Scotting here in a REAL long time!
My impression is that there probably ARE a fair number of Aussie 8-bitters
still around. But Australia is a real big place so those Aussie 8-bitters
are strung out all over. And very few of them are into modems & net stuff.
I'm pretty sure there's at least one active Atari 8-bit usergroup in
Australia, can't recall where... Victoria??? The 8-bit "blokes" in New
Zealand seem better organized, there are several active usergroups there.
But the same problem, very few of them are into modem stuff. Really a
shame. I kinda miss the perspective on things from Down Under.

Well, Mark, g'day to yah from a Yank!

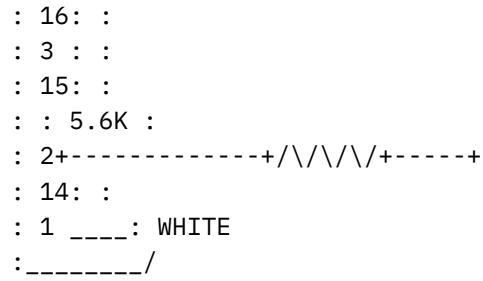
: : 18: :
: 5++ : :
: : 17: :
: 4++ : :
```



This is just a quick and dirty transfer program I wrote. It uses a slightly different cable & will work for getting a real telecommunication program to the 8-bit. It'll transfer any file, including binary, BUT ONLY TO THE 8-BIT!

First run this program on your IBM or clone to set the serial port speed.

```
10 OPEN "COM1:300,n,8,1,RS,CS0,DS0" FOR OUTPUT AS #1
20 CLOSE #1
```

After running it type SYSTEM & hit RETURN. You can also run a communication program & just try to connect @300 baud. Every one I've tried just exits back to the C: prompt & leaves the serial port at 300 baud. Now just run the Atari program;

RECIEVE.LST

Then copy the program you want to transfer to COM1

COPY BURGERS.OBJ COM1

When the file's finished transfering, just hit any key on the Atari to wake it up & save the program.

1060. AT800XL ZIP docs in english???

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-12 06:23:45 UTC
From: wexler@gibbs.oit.unc.edu
Message-ID: <2lrn5h$r9c@bigblue.oit.unc.edu>
Source record: 102641

I hope I am not flogging a dead horse, but I foudn the free AT800XL ZIP file in wuarchive in the msdos_uploads emulator atari section, and it looks very nice, if small on my screen. However, a) the docs are in this cute but annoying ascii animated thing (a bbs lover at heart wrote this) and then are all in german!

Ihave a friend helping me out, but if anyone has them in englihs, please post here, mail me, or let me know hwere to find them.

Also, on watson.mbb.sfu.ca is a growing collecction of C64 zip files. I hate the commode door, so I ask if there is any way wec ould have a site with atari stuff ready to use in this emulator... I know there is a legal question, but it could be overlooked at least for experimental purposes, for a littel while, maybe perhaps...

Anyway, any help with this file would b eappreciated, adn I will post eh english once I get it...

Thanks,

Michael

Yeah, but here at TIAC, we receive that hierarchy. In fact, we get ~6600
newsgroups, including VERY localized groups such as ba.forsale (Bay Area,
San Francisco, CA) and csuf.class.cis101, which, if it DOES exist, is a
VERY LOCAL discussion newsgroup at Cal State Fresno, for the CIS class
number 101. *NAH* I don't think there IS an aus.*.atari.* group.
We even get Netcom's local groups, and same for CERF, etc. Too many,
IMHO! Can you imagine how LONG it took me to set up my .newsrc? Even in
tin's group selection screen. GAK!

Regardless of who would want to do this, it has been done (allegedly) -- a PC emulation on the Atari 8-bits. According to Shiraz Shivji in an interview for Byte [December '85, portions rehashed for March '86 which I have in front of me]... "Actually, we have the work done on a machine that provides IBM PC compatibility with the 800xl." It was supposedly an outreach of this experiment, (where they wanted Apple II, PC, and 800xl support on one machine) that was to be the base for a ST expansion they were going to unveil at the '86 CES. Needless to say this was emulation via hardware... (built around a NEC V20 chip according to Byte, but Shivji mentions the ST unit as having an 8088)

A couple questions, 1) does Shivji still work for Atari, I haven't kept up, 2) did Atari ever introduce the box to make an ST IBM compatible, and/or did this evolve into the ill-fated PC clone line from Atari 3) wouldn't a prototype of this expansion unit for the 800xl be a heck of a collectors item?

From: junkster@halcyon.com
Message-ID: <2lu9ko$gbg@nwfocus.wa.com>
Source record: 102457

This was gonna be a simple question but I think it may get out of hand.

My query was going to be "Why do people want Atari 8-bit emulators for the PC?"

Some people want to relive the old days, I suppose, and maybe tramp through all those disks of classic games sitting in a shoebox somewhere. And I have a nagging feeling that there are a load of people would just love a big 'ol archive filled with every 8-bit game ever made so they can overdose on free 8-bit entertainment for a few weeks, as has been the norm with the C-64 emulator.

This critical train of thought led to the poser "What the heck do people actually do with their 8-bit machines any more?" I subscribe to and read and enjoy Atari Classics. The emphasis so far has been on fun hardware hacks and upgrades. Most of the threads in c.s.a.8 have been similar, or discussions of thr aforementioned classic games. Those are fun too.

Now I don't have a problem with any of this. But it leaves open the nagging thought that no one, save Ben Poehland, actually *uses* their Atari 8-bit for anything these days. If this is so, that's okay. But I'd like to know if this conclusion is accurate or if there are some serious loonies who, for whatever philisophical reasons, still actually *believe* in the 8-bits. I'd love for those adventurous souls to expound their philosophies and generally explain themselves for the betterment of the ongoing classic 8-bit movement. Really.

j >
j >James Hague

Well, myself for one. True, my 130 doesn't look anything like it once did, it's now located in a MiniTower hooked up to a BlackBox, hard drive, 5.25 and 3.5 high dens. drives, a gutted Indus on a seperate supply and TransKey PC keyboard adapter. And it sets here on my desk at my office and is what I do my written, database, VisCalc and telecom work from. Every building spec. Current Notes article, fund raising reports, mailing lists, budgits, articles for the American Derm. News letter and too many other things are done every day on this machine. Yeah, I've two IBM's (386/486) for AutoCad and several Mac'S for DTP work, but I sill use my 8bit for all my real work.

Now, you're asking why... Why not... I can not type any faster nor spell any better on a faster machine than I can on this one. My mailing list's do not exceede 300 entries...easly handled by SynFile and DiskBase. Believe it or not, I put spec books together using SynFile, the output going to TextPro for page setup and printing... True, I could do the same thing using DBase 3+ or 4... Sure, I could use WP51 or 6X with Windows and have lots of fancy fonts and snappy little icons...but why... Simple fact is, I don't need any of those things. I needed AutoCad, I got an IBM to run it. I needed to do DTP work, I got Ready,Set,Go and a Mac.

Just because a bunch of folk think they need a 468 DX/2 66, Windows 3.11, 8 meg of ram, a Gig drive, Word 6.1, etc just to type a two page letter doesn't make right. I've a 24 pin printer hooked up to my system, and letters printed on my letterhead look the same from either the 386 or the 6502. and yes, I've run a HP550 off the 8bit as well.

The simple fact is, almost all of these home users that "Need" those high powered systems are just looking for Game Machines... Almost everyone I know who "had" to upgrade to a 486 uses their machines for almost nothing but game play...these folk don't use their systems for "real" work either...does that make 'em loonie too?

Look, the system works for me, does all that I want it to do and I don't waste alot of money on things I don't need or want. And just for S&G, there are two schools here that still use the 8bit in the class room, one is running off a second hand MUX, MIO, 20meg drive, networking 6 systems all for under $200. Using Action!, Mac/65 and CC65 you can still teach computer basics w/o blowing out a limited budgit.

Anyway, to answer you're question, Yeah, I too still work my 8bit and likely will until it just plain dies.

1081. Re: emulators 'n stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-13 15:03:54 UTC
From: kamaro_kid@delphi.com
Message-ID: <ZayPAka.kamaro_kid@delphi.com>
Source record: 102462

I still actively use my 8bit system for just about everything.

Why not? It has more HD storage and almost as much Ram as my PC.. and
it boots up faster and is easier to use.

I dont feel I have to explain why I'm still using it - suffice it to say,
it's an enjoyable machine to use.

My system consists of:

4meg upgraded 130xe
256k MIO
350meg of hard drive storage
1.44meg 3.5inch drive
1.22meg 5.25inch drive
Happy 1050
ATR8000
Hayes Ultra 9600 v.32 Smartmodem
Commodore 1702 color monitor
Goldstar mono monitor
XEP80 80 column unit.

1082. CTH still going, othe

Hey Mike!!

Noticed you placed the name of my board up there with an elite few <g>, so I thought that I'd pass to you an update on the system, since I'm not sure as what baud rate your calling with.

I went multi-line as of yesterday (Saturday, March 12).

Won't go into detail about all of the aspects of the system (I know that is not allowed), but will make sure you have both numbers (hope it's not a problem).

Warp 10 BBS Line #1: 612-489-9166. 300-14,400 baud.
Warp 10 BBS Line #2: 612-489-8794. 300-2400 baud.

Source record: 102464

I'm looking for replacement Analog Data Disks that were either lost, stolen,
or stupidly destroyed. The numbers I'm looking for are:
1 through 10
Number 15
Number 17
Number 52
54 through 58
Will pay a reasonable charge plus shipping.
Thanks

junkster@halcyon.com (James Hague) writes:
]This was gonna be a simple question but I think it may get out of hand.

[important stuff deleted]

]This critical train of thought led to the poser "What the heck do people
]actually do with their 8-bit machines any more?"

[Less important stuff deleted]

]But it leaves open the
]nagging thought that no one, save Ben Poehland, actually *uses* their
]Atari 8-bit for anything these days. If this is so, that's okay. But
]I'd like to know if this conclusion is accurate or if there are some
]serious loonies who, for whatever philisophical reasons, still actually
]*believe* in the 8-bits. I'd love for those adventurous souls to
]expound their philosophies and generally explain themselves for the
]betterment of the ongoing classic 8-bit movement. Really.

This here serious loony still believes in his 8-bit. At one time I did
everything on it: word processing, spreadsheets, telecomm, music, and
even the occasional game. As they were growing up my boys went through
MANY of the 8-bit games.

Now I do all my wordprocessing and telecomm on this here Atari ST. I
have even recently picked up a couple of DTP programs and intend to try
that. My 8-bit is set up on its own desk across the room from the ST
and gets much less use than before. I know it's not my platform of the
future; but that doesn't mean its usefulness has entirely passed.

Today, I STILL have several spreadsheets I maintain on SynCalc, the best
program ever written for the 8-bit. I still use the 8-bit when my wife
asks me to arrange some music for her. My youngest has his 64 KB 600XL
at college with him, with XDM121 and AtariWriter, and has so far been
unwilling to change to my spare ST. And when my boys are over to visit
they still prefer to fire up the 800XL for a few games over any form of
entertainment the ST has to offer.

The bottom line is that the 8-bits still do as much as they ever did,
and if that meets your needs it's difficult to justify spending money
just to have something different meet the same needs.

BTW, I'm NOT one of those crying for an 8-bit emulator for the PC. My
Xformer cable allows me to transfer files between the 8-bit and ST, and
that's all I need. I WOULD like to see a way to use my spare SM124 mono
monitor with the 8-bit and an 80-column word processor, for my son's
sake if no other.

Source record: 102466

(James Hague asks what people do with their 8-bits.)
I have 256k 800xl, Ramrod 800xl, 130xe, 2 800s, 1200xl and
a for parts 800xl. I also have 3 xt clones and an ST.
The ST is in a box. It got rarely used for games and MIDI.
My xt is my primary word processing, data base, comm computer.
That leaves my 8-bits. I know more about it than any of my
other computers. I know enough to know that I would like to
know more about it. I got an oscilloscope to see some waveforms,
SAM's photofacts to look at schematics. I would like to know
more about how computers in general work. I 'repair' my 8-bits.
Lately, I found some mylar strips with metal pins at an
electronics surplus store and repaired the mylar on my 130xe
where the mylar strip's painted circuits had broken. I'm also
involved in a project to make an 8-bit unzipper. My unimploder
part is pretty well finished.
Someone else is working on an unreducer. I got a 'C++ for
Pascal programmers' book to learn some C so I can make
the inflater part of an unzipper. We may have an 8-bit
unzipper in about 6 months. Think anyone will still be
around then?

>talk again?

That kinda sounds familiar, actually. I haven't used SDX and the Indus GT
together enough to say for sure though.

I've also never seen the DOS XL/SyncroMesh combination, so I can't compare
that with SDX.

>who "had" to upgrade to a 486 uses their machines for almost nothing but
>game play...these folk don't use their systems for "real" work either...does
>that make 'em loonie too?

This is really funny, but absolutely true. Games is the only reason I
would consider buying a IBM clone. And you'd need a top of the line
machine to make the most of the best available programs. It's funny
because they call those 'other' computers game machines. :-)

Fortunately, I don't think I will ever have to buy one. Jaguar/3DO/???
will supply the game niche in the future for me I think. I'm going to wait
and see who ends up with the best programs and controllers.

One other thing to keep in mind about the 8 bits, is that there are a lot
of people using them as character generator display systems in commercial
industries like cable TV and hotels. Myself and at least 3 other companies
are still selling 8 bits and/or CG software.

Message-ID: <2m048a$f54@usenet.INS.CWRU.Edu>
Source record: 102470

(James says he wants to know more about the 8-bits.)
One other thing about the 8-bits. I've had college courses
in assembler, algol, fortran and Pascal. My CLSN Pascal
on my 8-bit with MIO is about 5 times as fast as the compiler
I used on a VAX doing time sharing with cs majors that kept
seeing how much core memory they could hog and how much they
could tie up the machine's timesharing with their high access.
My 8-bit will boot DOS and be ready to go in about 2 seconds
from the MIO ramdisk. My xt takes about 40 seconds to boot up
load all those tsrs and autoexec.bats, etc. The ST? Well,
I would like to hear a REAL engineer's opinion of the quality
of the engineering in the ST line. My opinion is that it is
EXTREMELY data unreliable, a reason why I would never get
a hard drive for my ST. The first thing I learned about the
ST is that it trashed disks with a power surge using a
power strip to turn the monitor, modem, printer, disk drives,
etc. on and off. A disk in the drive when the power strip
was turned on or off got trashed. Then I spent about 2 years
when I had to restore the disk EVERY time I booted up.
I was ready to sell the ST. Then I found out my special
shelf with the disk drives right under the monitor was my
problem. The 1224 monitor was putting out RF the clobbered
disks. A cookie sheet under the monitor finally fixed that.

>
I think the Amiga 1200 would be a better base configuration for an emulator.
It can do the 256 GTIA colors easily. DLI's would be emulated via Copper
(graphics COProcessER) lists.
I think an Atari 8-bit emulator would be great to have on the Amiga.
Supposedly there is one in the works for use with the EMPLANT (emulates
everything) board. I'm keeping my fingers crossed.

1094. Converting disk -> cartridge, possible? how?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-14 02:26:13 UTC
From: jleon@phakt.usc.edu
Message-ID: <2m0i05$q36@phakt.usc.edu>
Source record: 102475

Hi, I'm the one who asked about a SX212 for sale. Well, I got an offer ($30 for it, what do you think?). Now I also know that it only comes with a program disk but not a cartridge.

As I said before I want to give my dad the less amount of problems possible so I was wondering, is there any way to put the communication program in a cartridge? I have access to an eprom programmer and also have some old cartridges that i can sacrifice. Is this possible?

I also know that there's a cartridge with a comm program (telelink?), does anybody know if I can use it with the SX212? If the answer is yes, does anybody have one for sale?

Thanks for any help!

Juan Leon.

In a slightly stale article (I'm a bit behind), Raphael Espino - rje@cs.nott.
ac.uk writes:

>(Occasionally quoting thester@nyx.cs.du.edu (Uncle Fester))

>[...] just go ahead an pirate instead, it'll get you
>what you wanted: the software, and probably help another company go bust in
>the process. [...]
>
>[...] How long will it be before the support
>on this side of the water dries up too? And it IS happening.
>
>I disagree with your views, pirating in any of its forms something to be
>avoided if we still want people to produce new and re-release old software.
>[...]

I will return to the above points in a moment. Just wanted to include the
text I'm going to refer back to.

>Anyway does anybody anywhere
>take the "I don't like this game therefore I'm returning it" excuse?
>Does anybody provide full satisfaction or money back guarantee when it comes t
o
>software? Surely such a thing would encourage piracy:
>Pirate sends off for game, copies it and send original back saying "I didn't
>like it, I want my money back", and ends up with a free game.

One of the risks you take when you go into business is that not every cus-
tomer will be on the up-and-up, but historically the assumption has been
that the majority of customers will be honest, and that providing money-
back guarantees is a Good Thing because your customers feel protected and
safe when buying your products. If that basic trust between seller and
buyer can no longer be assumed, we have much bigger problems than the de-
tails of Atari 8-bit software availability and you'd better log off now
and start growing your own food while you can still buy seeds. And if
that basic trust CAN still be assumed -- and the millions of honest trans-
actions going on around us indicate that it can -- then your reasoning
that "(a guarantee) would encourage piracy" comes off as paranoid, and
anyone using it as a reason to "screw the customer before he screws you"
is going to be a most unpopular vendor indeed, go out of business quickly
as his reputation spreads, and doubtless blame the failure on "piracy"
rather than his own unpleasant business ethic.

In THAT case, I could probably be convinced that the pirate was merely
doing to YOU what YOU were trying to do to HIM. It's a hell of a way
to live, but "you asked for it" by starting out assuming he was GOING

to steal: people tend to live up (or down) to our expectations of them.

And then there's Sturgeon's Law: "90% of everything is crap." If I buy something from you, be it software or any other thing, and it turns out to be of low quality, and I wish to return it for a refund and you say no, I will be unhappy with you. I might write a letter to you expressing my displeasure and asking again for satisfaction. If you persisted in your obstinacy and my ire were great enough, I might seek legal recourse in the form of a lawsuit or whatever other action were appropriate. And if THAT failed, well, I myself would probably give up, having had my fair chance, and at one time nearly EVERYONE would have likewise given up -- but in this day and age, SOME people just might find other ways to get back at you, such as by pirating your product if it were software. It might not be "right" according to society's public standards, but it sure as Hell is human nature and a lot of people would secretly (or not so secretly) applaud your vengeance. This is probably the wrong forum for me to go into further detail about "public standards" vs. "human nature," but suffice it to say I think we'd all be happier, deep down, if the former were revised to admit the truth of the latter...

>Piracy just serves to knock down the few remaining companies. And just in
>case you're wondering nearly 100% of UK companies are either defunct or won't
>touch the A-8bit too, all of those left are because the people running them
>are A-8bitters themselves.
>> The 8-bits are dead, the
>> infrastructure that supported them is dead, and the
>> number of people that still use the things is pretty
>> close to dead as well. :-)
>Not quite true, certainly the user base and infrastructure is no where near
>as big as before, but some does still exist, but that too is dying, piracy
>will only help it die even quicker.

Well, gee, if it's as bad as all that, why knock ourselves out saving it? If it's on its last legs ANYWAY, it's almost more merciful to give it a quick death by a quick conk on the head, than to let it linger and gasp.

On the other hand, Rafe, you argue (basically) the same old line that "piracy hurts software producers," with which I don't necessarily agree. Perhaps it hurts software producers who are IN IT FOR PROFIT, but that is hardly the only (or even the best) reason for producing software! Go ahead and pirate the commercial Atari 8-bit software industry into the ground and you'll STILL see new Atari 8-bit software come out from people who just plain ENJOY it. Sturgeon's Law says that 90% of it will be crap, but the same holds for commercial software so you have lost nothing -- except, perhaps, VOLUME, which we know we are going to lose ANYWAY, eventually.

Every 8-bitter I know of pretty much takes for granted that the industry is dying, and that we will all probably far outlive even the last and most die-hard Atari 8-bit vendor no matter WHAT heroic measures are taken to save them. That being the case, in the long run it JUST DOESN'T MATTER whether we pirate or not! At some point we will still all be thrown back

on our own resources, crafting our own replacement parts when real ones run out, cobbling up hacks to use new and different storage devices when the last 1050 drive bites the dust, etc. Eventually someone, somewhere, will piece together the last working ANTIC and POKEY to form the last functioning Atari 8-bit system on the planet, and eventually THAT, TOO will die. At best, we can merely postpone the inevitable, and if we have to be miserable for the duration, maybe it's not worth it. An uncle of mine had a heart attack before age 40, and his doctor told him to quit smoking. But my uncle loved to smoke, and knew he would be miserable without it. So he made a conscious decision that he would rather have a few happy years enjoying cigarettes than a great many miserable years doing without them. He died young, but he enjoyed life. Each Atari 8-bitter faces a similar choice: pirate like mad, get all the games you want, and enjoy them while you still have a machine capable of running them, or DON'T pirate and spend the remaining lifetime of your system pining for those games and hoping for a miracle (which I, for one, do not expect to happen).

>Nothing personal, I just don't feel that piracy is the correct avenue under
>any circumstances.

I feel that at some point you have to throw your hands in the air, admit defeat, and just go for it.

I'd like to know what's involved in programming an EPROM. I am
totallt clueless in this department: I know you need an EPROM
programmer, and thats all I know. What does one cost? Does one
need to know assembly/machine code or do it? Will an EPROM programmer
that works for an Atari cart also work with, say, Nintendo?
Just curious...
-Kevin Savetz

>anybody know if I can use it with the SX212? If the answer is yes, does
>anybody have one for sale?

I have a "Telelink I" cart; there was also a "Telelink II" at some point in time. I know relatively little about either of these, as it has been over TEN YEARS since I saw or used either of them and do not have instructions for the one I have (bought it used and have never used it myself). I DO know that Telelink I is a "dumb ASCII" terminal, though, so does NOT respond to ANSI or any other "control" or "escape" sequences. I believe it has a "text capture buffer" which you can print or dump-to-disk, but no other form of file transfer. It's very, very dumb as terminal emulators go, even on the Atari.

I would expect that you could use the cart with the SX212. At first I was going to say that you could NOT, because you would have to boot a disk containing a device handler for the SX212, THEN run the cart -- but, silly me, you had to do the SAME thing for the Atari 850, and Telelink worked just FINE with THAT. The bottom line is that I could just darn well TRY it sometime.

Or YOU could; I'd be willing to sell it for a couple of bucks if you want it.

1100. Re: Gemulator + STXformer = Emulation on PC?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-14 10:19:14 UTC
From: bmarcum@iglou.iglou.com
Message-ID: <1994Mar14.101914.13175@iglou.com>
Source record: 102481

To be precise, Gem isn't the operating system, it's a graphic interface like Windows or GEOS. The ST's operating system is called TOS, and there was once a version of GEM for the IBM PC. However, Gemulator is an emulator to run ST software on an IBM.

1101. Re: Converting disk -> cartridge, possible? how?

Disk programs on the Atari can be as easy to use as cartridges. They just take a little while to load.

OK... I'll trash my 130XE tonight. :)

>On the other hand, Rafe, you argue (basically) the same old line that
^^^^
Can't ANYONE get my name right??????

>Go ahead and pirate the commercial Atari 8-bit software industry into
>the ground and you'll STILL see new Atari 8-bit software come out from
>people who just plain ENJOY it.
you're right!

>I feel that at some point you have to throw your hands in the air, admit
>defeat, and just go for it.
OK *throws hands in air - admits defeat* OK, I was wrong, I am sorry (again).

While I'm at it I might as well make another anouncement, I've decided to stop writting my own software, well maybe I'll continue writting it, but I won't try and get it released anymore, just for personal use. Not that I ever made a profit from it, in fact I most probably made a loss all things considered, but I used to do it because I enjoyed it. Anyway I realy don't have the time right now, and I don't seem to enjoy it quite so much anymore. So I suppose if I ever release anything again it would have to be P.D. which is very unlikely since I can only finish things when I've got a strict deadline to work to.
(not that most people reading this group would know, but that last comment was for the few that do)

Raphael Espino - rje@cs.nott.ac.uk

My 600XL computer (my first computer, btw) might have what you call
deficient video. It has always had poor screen quality (using the RF-lead)
compared with a 130XE computer and an 800XL I picked up later. How can it
be fixed?

FOR SALE:

Atari 800XL
Power supply
Dig Dug Cartridge.

This is for a friend. Please e-mail me if you're interested and I
can tell you where he can be reached.

{-------------------------------------------------------------------------}

ALSO FOR SALE:

Atari 1200XL w/ Power Supply
(There may be a problem with the peripheral port, I'm not sure)
BASIC Cartridge (as the 1200 does not have BASIC)
We've a number of power supplies in the house from various Atari
computers/components we have owned.

This is for my parents. Again, if you're interested, e-mail me and
I'll tell you how to get in touch with them. Thanks!

Welcome to CSA8, Chris.

When's the last time you DID pull that Atari system out of the cobwebs
and make use of it?

You may have missed virtually hundreds of new and exciting titles, ranging
from games to utilities.

1109. Printer Interfaces from Rambit.

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-14 13:11:23 UTC
From: RG9@VAX.YORK.AC.UK
Message-ID: <9403141310.AA29988@cs.utexas.edu>
Source record: 102490

This posting is being done as a service by Richard Gore on behalf of RAMBIT.
All replies should be sent to the address given at the end of the posting.

We are pleased to send you details of our PARALLEL PRINTER PORT for the Atari XL/XE computers, connecting to the parallel bus interface (XL) or enhanced cartridge port (XE). The P.P.P. is designed to enable you to connect EPSON compatible printers such as Panasonic KX-P1081, OKI-82, MP-165 etc. and print at their designed speeds, ie not slowed to serial speed.
The P.P.P consists of a compact unit which plugs directly into your computer port and outputs through a standard female 36way centronics socket connected to the printer using the lead supplied with the printer (possibly!).

The software necessary to drive the unit is best incorporated into your OS on EPROM so accessed by normal legal IO calls. Your system is so adapted as to allow use of your utilities (provided they only make stnadard use of the OS, 99% do) whether cartridge, disk or tape without any alteration of them.

TECHNICAL CONSIDERATIONS.

Power for the unit can be taken from the printer on pin 18 of the connector, or from the computer as desired. Should your printer be non-standard parallel, quite possibly we can advise on tailoring to its specification!

Alteration of your cable, ir change of plug or reposition of individual wires, willonly be necessary if it has no male 36way centronics plug on its computer end and/or full 36 wires present.

SUMMARY OF REQUIREMENTS.

PRINTER:- does it output +5volt on pin 18 to the cable? If not check pin 47 of your XL pbi, wiring of this may be necessary.
:-printer signals as follows, SELECT and BUSY both active high, ACKNOWLEDGE and STROBE active low; differences will require tailoring at no extra cost!
CABLE:-fitted with male standard 36way parallel (centronics) plug at computer end.
COMPUTER:- for supply of EPROM driver details of your existing OS will be required and may involve fitting of a DIL socket to hold it. Kit also lends itself to being fitted inside your computer or having printer lead soldered too it.

Prices all inclusive, Overseas +10%. Sterling only, cheques or postal orders made payable to Rambit.

KIT WITH EPROM for XL or XE ....#20

prices for ready assembled by negotiation.

We aim to satisfy and consequently will do our best to give technical support, answer genuine queries and will be pleased to accept your comments. We will also update/re-record on receipt of out original disk/tape with return postage.

Address: RAMBIT, 16 THE GREEN, THURLBY, BOURNE, LINCS., PE10 OHB, ENGLAND

telephone (in UK): 0778 424450

Additional comments by Richard GORE:
Dave Richardson the man behind Rambit is very technical and I'm sure he won't mind me saying has difficulty in writing using non-technical jargon. The above posting sounds pretty complex but what he is saying is he has available a printer interface that plugs into a PBI on the XL or XE and can be tailored for non-standard printers.
I also know he has experimented with using these kits to get two computers interconnected and I think has created an RS 232 interface.

If you are at all interested in such projects I suggest you write to him at the address given above to find out more.

|> or print dump program would be a perfect start!

Hmmm...this TIFFREAD is not a driver, but a program by itself. It was written to be compatible with Epson-standard printers (mine's a Citizen GSX-230, 24-pin, B&W). I doubt TIFFREAD is Canon-compatible...do you have all the documentation about the graphics modes? In electronic form? I could take a look at it and figure out if it could work.

Source record: 102497

Visicalc files are stored as uncompressed scripts... not
compiled/compressed spreadsheets

It might be easier to convert them to macros for Lotus (if you store the
number in cell A1 in visicalc, it does not save a spreadsheet with the
number in A1, instead it stores the text command to go to cell A1 and
then enter the number... you may be able to convert a visicalc
spreadsheet to a macro file that simply types the spreadsheet into
lotus... not having lotus, I do not know the form of their macros).

Well, they also take a disk drive with it's power supply, cables, etc.
That is my problem. Not enough room to leave my 8bit set up and too
much trouble to set it up to play games for an hour or two. Not too bad
if all I have to do is hook the computer to the TV and insert a cartridge.
That's about the only way it gets used these days.

The responses so far have been most heartening, please keep posting 'em.

I'd like to make clear though, that I wasn't trying to say that using the 8-bit machines in 1994 is completely looney. I was/am trying to determine if there is any *real* interest in the machines in more than just a nostalgic sense. It is difficult to tell sometimes, and that makes it hard to figure the success of the atari classic movement.

For the record, I own 3 8-bit machines (800, 800XL, 130XE) and the XL is sitting on my desk right next to a PC clone, attached via SIO2PC.

1124. Info on making SIO device

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 00:52:22 UTC
From: bryedewa@news.delphi.com
Message-ID: <2m30s6$7go@news.delphi.com>
Source record: 102555

This is fairly technical, but I was interested in designing SIO interfaces
for various uses, and I wondered if anyone has info on it. I mainly need
to know if there are certain IC's I should obtain to make it easier. I
would imagine I would need some synchronous serial logic. Thanks!
-Bry

1125. Re: emulators `n stuff

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 00:54:29 UTC
From: jomcgow@eis.calstate.edu
Message-ID: <2m3105$c30@eis.calstate.edu>
Source record: 102556

I keep grades in Syncalc, lists in Synfile and print letters using DaisyDot3, with my Print Shop icon to DD3 loader to produce a letterhead with a Sherlockian graphic. I view GIFs with my 8 bit, and even, though I hate to admit it, sometimes play games on it. I print mailing labels with PrintShop icons and Daisy Dot 3 fonts.

NOSTALGIA? HELL!

I use the 8 bit because it works... else I would not be posting this using OmniCom.

>
>One of the risks you take when you go into business is that not every cus-
>tomer will be on the up-and-up, but historically the assumption has been
>that the majority of customers will be honest, and that providing money-

A good point, all part of being in sales...you build your customer base
and they support you. However, a point is made reguarding customers who
do go out of their way to rip off retail sales... Still, it only
takes once to learn who's who.

>And then there's Sturgeon's Law: "90% of everything is crap." If I buy

i.e. Sturgens's Law...

>"piracy hurts software producers," with which I don't necessarily agree.
>Perhaps it hurts software producers who are IN IT FOR PROFIT, but that
>is hardly the only (or even the best) reason for producing software!
>Go ahead and pirate the commercial Atari 8-bit software industry into
>the ground and you'll STILL see new Atari 8-bit software come out from
>people who just plain ENJOY it. Sturgeon's Law says that 90% of it

Well, here is where you lose me... Sure, you made some valid points in
the first part of your post regurading fair dealing with the public, but
the above bit is pure idiocy. Having worked for myself for the last 13
years, I can tell you I do it for the PROFIT...feeling good don't pay
the bills. You go take the above line and tell it to the likes of Bill
Gates, Steve Jobs, Bill Atakins etc... Tell it to the folks at Intel,
Apple, Apollo, Sun and see what they say... The hell with all this crap
about pirates and piracy, its real simple, the kind of thing they used to
teach in Ec101... If a product and or service is good, it'll survive...If
its bad, I'll pass on... On the other hand, a good product that makes no
profit is seen by its makers as a loss and is discontinued... Get the point.

Didn't think so...

Look at what almost happend to CTH... It was support from users (read
customers) that kept Tom's board alive... Look at FTe, do you thing you'll
see anything new from him if he sees no profit in it? How many folks her
do you think would like to see 80 col support, support for IDE drives,
Fax Modem support? Well, it ain't gonna happen unless someone thinks they
can make a profit... Get the point....

Yeah, I know what you were talking about was acquiring software that is
not being sold, and who's owner will not release it... Shit happens, and
people are going to do what they have to do... As others have said, this
question has been beaten to death... You've offered nothing new...

Oh yeah, just a tid bit O news, seems Nick Kennedy is working on the next upgrade to SIO2PC, he's trying to support modem passthru as well as printer passthru... Seems he decided to start work again on SIO2PC after not working on it for a year, because of increased user support (read, shareware fees). Get the point yet?

Didn't think so...

Heh, I read this post because I thought it was about M.U.L.E., the best
game ever written for the Atari. (Second best was Jumpman, IMO.)

By the way, it looks like I've pieced together a nice 8-bit system in
trade for Mac CD-ROMs. I'm still looking for another floppy drive, maybe
a track ball or graphics tablet... Whee!

If the answer is yes, does anybody have one for sale?"
There is also the Express telecommunications cartridge (if you can find
one for sale).

1134. What 8-bits are useful for...

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 08:17:00 UTC
From: aramos@cgrg.ohio-state.edu
Message-ID: <2m3qtt$6b0@sleepy.cgrg.ohio-state.edu>
Source record: 102565

It's 3am and I'm taking a break from studying for finals...please excuse
the following incoherence.

James Hague (great software btw jim) asks if anyone actually uses their
Atari 8-bits for anything. Well...

My 8-bits fill many roles in my computing needs that my bigger, more
expensive 16-bit systems cannot. For example, I have an analogue synthesizer
whose sounds can only be altered via MIDI commands. There are many Mac
and ST programs to do this, but they force you to point at an on-screen
control using the mouse, and wiggle it left and right. I wanted to
shape the sounds using _knobs_, in real time, like a real synthesizer.

So, I wrote a custom patch editor for my trusty 130XE and MIDI interface.
Those great controller ports let me plug in four paddles, so now I can
change any aspect of the sounds I'm performing, live, just by turning
the knobs.

I'm also active in the local 'rave' scene, doing lighting and video
projections for warehouse parties. For our 'chill-out' rooms I set up a
Vectrex, an Atari 2600, and two or three 800s running non-combative,
'eye-candy' programs such as Jeff Minter's Colourspace and
Douglas Crawford's "Jane's Program". The 8-bits have dual video outs,
so I can route the graphics to both a monitor and a video projector.
The ravers love having something to play with while they're
taking a break from dancing, and they get to make their own light show
while they're at it! Nobody bothers the computers since they're "just old
8-bits", and the 800s have withstood the heavy use just fine.
(By nature of the graphics, this use probably does fall into
the 'nostalgia' category. <grin>)

I'll probably rewrite the patch editor in C++ and port it to another platform.
I just wanted to show you there are some uses for which an 8-bit computer,
and sometimes the Atari 8-bits especially, are a perfect fit.

Tony R.

Hi all,

Well, I got some encouraging responses to my announcement about creating an XL emu. I've started work, and have code for the 6502 which needs some modification. I want to start looking at the tricky bits, IE, Antic, Pokey, GTIA, the disk formats and the sound production. I have some information, but I would like as much as possible. So, Please, if you know anything about these things, please mail me and tell me as much as possible. Doesn't matter how small. Oh, also the cassette format (standard or otherwise). All of these things need to be considered. If anyone from Europe is reading and they have any circuit diagrams, documents, etc., that you can photo copy, let me know....I'll pay postage if needed.

Thanx for the support, but please keep it up....

Cheers, Zargwog...

I would recommend getting a copy of the Atari 800 Tech Manual, which I
believe American Techni-vision sells. It has a great deal of hardware
and software specs for the communications over the SIO bus.

I think both sides are missing somewhat part of the point here. A viable market needs to exist for ANY commercial success. I have seen this before as a long time computer hobbiest whose initial platform became obsolete years ago. The last thing to go is the publications. The only commercial ventures still ongoing are what I would call a "labor of love" on the part of the proprietors. The Atari 8bit does have somewhat of an advantage in the seemingly still partially viable European user base, but seriously how much product does anyone think they can move when the subscription interest in Atari Classics was at its peak of about 500, and I understand (correct me please Ben) renewals are running only about 50 percent of that.

Everyone is not going to be interested in 80 column support, and even those that are may be interested in more than one of the possible solutions, The same may be said for any kind of hard drive support, etc. Remember too, any new solution has to compete in the marketplace with the very real used market. Anyone who wants a hard drive (for example) enough to fork over real money is going to be aware that for something in the vicinity of $100-250 (a wide vicinity) he might be able to pick something up at a flea market, on the net, or from a local former user. This probably places a cap of reasonableness on the price (say) of a IDE drive interface at something like $50. I can't imagine that price would allow for more than about $10 profit per board. If 1/10 of the suscribors to Atari Classics bought one, that would be something like $250-400 profit or so. Not much to sustain a business.

Now that is hardware, which naturally has a much higher production costs in comparison to software. But then, the permissible price of software is going to be much less. For the sake of argument, let's say the profit per sale on software would be $5. The fact remains, not a lot of people will be interested in any specific piece of software, piracy matters aside. For example, I would never be personally interested in any communications package for the Atari, as far as purchase goes, because I would never use it. I use a PC for all

communications from home (currently). I would, however, be interested in an Assembler type package, and have bought some of the older stuff available here and there. BUT .. just because I like to help people with questions, I might try a copy of some communications package or other for the Atari. Would this make me a pirate? Technically, yes. No question about it. Would I feel morally guilty about it? No. Not a bit. Would I be contributing to the decline of the Atari community? NO .. more likely, if I was able to help answer someone's questions, I would be encouraging their continued interest.

It seems to me that a lot of the piracy debate may be sour grapes left over from the rapid decline of the Atari 800 series due primarily to marketplace competition from the Commodore 64. Many companies undoubtedly saw their sales go away very quickly, and saw piracy as a major reason. This was not the primary reason. The primary reason was the loss of market share of the Atari computers in general.

Today we are in a much different situation. There is an extremely small marketplace, and any producer had better be aware of that. More over, be as strongly aware that your competition is not piracy, but the used marketplace. Last year at the Trenton computerfest, I wouldn't buy any Atari hardware, people seemed to have too strong an attachment for it (I was strongly looking for a 1050 drive, but no one wanted to drop from $60 to $40 -- I later got two drives and a 1200 and software for $80), but I did buy a box of software for $20. Something like 40 different items. Less than $1.00 each. That's where the real problem is, as far as any hope of a new producer selling stuff. That is the real competition, and it barely makes it worthwhile paying the shipping on a disk. Have I ever pirated any Atari software? No. Have I contributed to the decline in the availability of new items in the marketplace? Yes. Definitely. Do I feel guilty about this? No, that is the reality of the marketplace. Competition is what one has to live with ... and, in my opinion the competition is not piracy, but the used marketplace.

I get somewhat of a tone thru this thread that, for example, some would think that by buying a copy of Visicalc as part of that box for an effective price of say $1.00 (allowing for the documentation and such) rather than buying one from one of the few remaining commercial vendors, I was doing something wrong. But I would never have bought one from a commercial vendor. I would probably not have paid $5 for a copy. I haven't used it as yet, though I will probably fire it up and take a look. Would I have taken a pirate copy? Perhaps. If I didn't have to take the time to make a copy of it. But consider that as more as being like browsing thru a stack of old magazines for nostalgia's purposes. But I wouldn't buy a copy .. I wouldn't even consider it worth the time it would take to copy the disk(s). Noone in my household would ever USE it.

Now a database program .. perhaps. I have often thought of putting an Atari in my stereo stand for control purposes. BUT here .. I am unfamiliar with any of the Atari database products, and would much more likely write my own mini-database in basic (or something) where I can integrate it nicely with the other functions. Would I buy a database program? Undoubtedly not from a commercial vendor, it's not worth it to me. But as part of a package,

say from the guy here at work that used to keep track of parts inventory for his area on an Atari, perhaps. Depending on how much was in the package. And you can be sure the effective price of the database software (to me) would be less than $5 or so. Maybe $10 if I had extra money that week and was feeling frivolous.

How can a commercial vendor survive trying to sell to someone like me? And I am not being unreasonable, I am just strongly aware of the used marketplace. And THAT is the competition.

1141. Super Products / Atari in Australia

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 14:30:11 UTC
From: mperry@cairo.anu.edu.au
Message-ID: <mperry.763741811@cairo>
Source record: 102572

My last few posts have generated some questions about Super Products (their SuperMAX specifically), SuperDOS and Atari in Australia.

I thought I would post the following info to answer everyones questions.

Right now, here is some stuff about Super Products.

Since the mid 80's, Super Products has been producing upgrades for 8 bit Atari hardware. Originally started by Will Visser (if I remember correctly), Super Products is now run by James Bradford.

They have the following still available.

Supermon: Replaces the OS with the rev B, no more translator disks for XL owners. Gives a full and super powerful disassembler always resident. Includes a four colour screen dump which will even do some redefined character sets or any mixture of graphic modes. Loads of built in features such as binary loader (without dos), hex/dec dec/hex conversions, complete disk access from supermon and other stuff.

SuperRAM: upgrades give you 256K XL's, 304K 800, 320K XE.

SuperMAX: US Doubler like upgrade for 1050's. Does not copy disks.

Super800: allows your 800 to run XL programs. With SuperRAM too, you end up with XE emulation (without the Antic mode) so you can run AtariWriter Plus etc. So you end up with the original 800 and the XL OS's and can switch between them. You also get Supermon with both OS's too.

So thats it. Of these I have SuperMax in my 1050 and it works really well. I just couldn't live without it now.

I also have a Supermon chip for my XEGS which I have not put in yet.

Oh yes, Supermon also automatiaclly enables the high speed mode on SuperMax drives.

In the next few months I will probably get a Super800 and SuperRAM for my 800.

Hmmmm, this is getting long so I will tell you about Atari in Australia later.

To contact James, you can phone him on 074 969 169. It's best if you ring after 6pm. Right now, the time difference between Australia and New York is 15 hours (east Australia anyway). There is also a 24 hour board you can leave a message for James on. The number is 074 976 293. 074 is the area code.

I guess I should say I don't get anything for this. I am just a happy customer.

Next post is on SuperDOS.

1142. SuperDOS

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 15:14:42 UTC
From: mperry@cairo.anu.edu.au
Message-ID: <mperry.763744482@cairo>
Source record: 102573

Okay, here is some info on Superdos. I will try and get the latest version onto the archive by the weekend.

This, and the stuff on the hardware upgrades were taken straight from the adds. You could not tell at all could you.

uperDOS V5.0 was designed for the more advanced user who needs a DOS with true double sided, double density operation. The aim was to keep the program short and powerful. Until now Atari DOS 2 seemed to be the most convienient DOS to use but was only capable of single density and was memory inefficient. Other double density DOS's are available but they use heaps of memory or are extreamly slow because you need to load a file to perform each function.

SuperSos combines many functions (and more) from some of these giant DOS's into an easy to use, menu driven DOS needing slightly more memory than Atari DOS 2.0S but using seven sectors less on the disk and therefore taking less time to load. With 64K RAM XL/XE and all SUPERRAM models, DUP is hidden in RAM under the OS or in the ramdisk and available imediately with NO loss of the resident program. The massive 256K SuperRAM ramdisk., plus 130XE, Axlon, Bucholtz, Newell, Peterson and RAMbo ramdisks are supported.

Features
1. SuperDOS for Atari 400/800/600XL/800XL/65XE/130XE computers, Atari 810, 1050, XF551 and compatible disk drives.
2. Single, Enhanced and Double density plus double sided, double density operation.
3. Handles up to 4 disk drives plus a ramdisk plus up to 8 concurrent files.
4. Auto density enables SuperDos to automatically configure to the density of the disk in the drive.
5. With auto density you can copy files from single to double density (or vice versa) with only one drive.
6. RESTORE deleted or open files, either from SDUP menu or BASIC with XIO commands.
7. Use upper, lower case, inverse characters or numbers even as the first char of a filename.
8. Short SYS files allows maximum use of disk space and memory.
9. Variable XL/XE key delay and repeat rate.
10. Ramdisks: SuperRAM & Peterson with 256K, 130XE with 64K or Axlon, Bucholtz, Newell, or RAMbo with 180K. Enables instant loading of files.
11. Autoload all files with "RAM" filename extenders from drive one to the ramdisk during boot process.
12. With SuperRAM or 64K RAM, SDUP is available the instant you type DOS

and the resident program is saved. No "MEM.SAV" waiting.
13. Use single keystrokes to list drrectory or select items.
14. Copy to or from casstette "C:" device using long or short IRG. Copy all SYS files except DOS.SYS using wildcards.
15. A verification prompt message gives you a chance to change your mind about copying a file.
16. Write DOS.SYS file only or format a disk wit h skewed sectors using SuperMAX, US Doubler or Atari XF551.
17. Copy sectors and display bad sector numbers. Copy only the used sectors.
18. Option to format destination disk during disk copy. It formats in the same density as the source disk.
19. Enter sector numbers in hex or decimal. Default is hex use # for decimal. eg #370.
20. Write with or without verify. Toggled from SDUP menu.
21. Drive status (density, sides) is displayed on top of the screen above SDUP menu.
22. Concise menu with plenty of room for directory listings. There are 2 columns on dirs.
23. Annoying Atari 4 line scroll removed.
24. A red screen border indicates next operation may write to the disk. Purple for format.
25. A red or green screen border to indicate write or read in next operation of copy file disk or sectors.
26. A binary save that even saves carts.
27. A copy from DOS 3 using 1 or 2 drives and wildcards.
28. SuperBIN - a boot program to display a menu of file names and load and run the bin file you choose.
29. Display the conmfiguration block of drives. (not 810 or 1050)
30. Trace and link data of files and patch around bad sectors.
31 Option to display deleted or open filenames.
32. Alter the number of open file or drive buffers from the AUX menu.
33. Choice of resident or non-resident SDUP. Enables instant access to DOS menu on 400/800 or option to disable the ramdisk.
34. SUPERBAS - an AUTORUN.SYS file to display a menu of BASIC programs to load and run.
35. I/O defaults to the ramdisk if one is available.
36. Use ESCAPE when booting to format a ramdisk leaving all normal 130XE banks free (requires 128K)

Okay, that's it. I hope you enjoyed reading it as much as I hated typing it. :)

>Atari 8-bits for anything. Well...
...
>I just wanted to show you there are some uses for which an 8-bit computer,
>and sometimes the Atari 8-bits especially, are a perfect fit.
...

I second that! I use an Atari 600xl to telnet to my work computer,
and a bunch of old "classic" machines to run various projects over the
years. One of my favorites: a slot car racetrack timer program,
triggered by IR leds, with a small TV screen serving as the track's
"billboard"; the racers get lap split times, total times, scale MPH,
and sound effects like the roar of the crowd when a new record is set.
The cost is minimal and the atari is dedicated to the track, something
I'd hesitate to do with even a 286 PC. Another project is a
temperature controller for my home beer brewing system, the atari can
regulate the ferment temperature and also record the bubble rate of
the escaping CO2.

I keep thinking about trying to put an atari in my (old) car, and have
gotten as far as rigging up some vacuum sensors and throttle position
mechanisms, but I'm afraid that project is on the back burner.

Right now I'm working on some software for my latest Atari classic
project, which is an IR interface. I've got the hardware, and can now
control all of my IR remote appliances through the atari. Hopefully
this will be complete within the next month or so.

The bottom line is that in addition to the nostalgia I get from
using this old computer -- I got my first job, in part, because I had
learned 6502 assembly language on the atari -- and of course I do play
games once in a while -- the atari classics are ideally suited for
playing around. If you burn one, heck, I have spare parts and spare
computers to last into the next century, so no big deal. The same
cannot be said of intel-based computers, at present, at least not ones
that have similar I/O capabilities and decent graphics built in.
As far as software development, well, CC65 running on my Unix machine
makes it a snap. I eagerly await the release of an X-windows atari
emulator....

The Classic Ataris are alive and well.

This article made a lot of sense to me except for one thing, probably
related to the reason many of us are interested in emulators: Why buy
a different computer for each application?
OK, you need to do AutoCAD, and the 8-bit just won't cut it. So you
buy an IBM. You don't want to move all the old stuff (word processing
and database) from the 8-bit, which does a good job of it, so you keep
that around. This part makes perfect sense to me.
What I don't understand is why, when you needed to do DTP, you bought
yet ANOTHER computer, when the first one may have been barely
adequate, and the second was was surely powerful enough.
Then you say you don't waste a lot of money on things you don't need.

BTW, my 1200XL and 486 sit side by side on my desk, but I haven't had
the time to play with the Atari in a while. :-(

Hi, I would like to know if there's any mail order place where to buy
8bit stuff (peripherials, programs, cartridges, etc.) here in the US.
If anybody know about such place please let me know a phone number, address
or anything. I know there are some place (I saw a bunch of them when I
was getting my Antic magazines, but now no more magazines :-))

thanks

> I have an 800 and wish to copy Visicalc data over to Lotus 123 on
>a PC, Is this possible ? I have no modem on the Atari so wish to be able to
>read the Atari's disk on my PC.

First step is to get the file to the PC:

If the two machines are in the same room, and both have an RS232 port
(e.g. 850 or P:R: Connection on the Atari), you don't need a modem to
directly transfer the file; just make (or buy) a null-modem cable and
connect it between the two.

In order to make the PC read Atari disks, you need a utility on the PC
such as Util or SpartaRead (both available from
atari.archive.umich.edu). Your disk must be double density (not the
stock 1050's "enhanced"/"dual" density). Use Util to read MyDOS
format (DD Atari format) and SR to read SpartaDOS format.

As for data file conversion:

Off the top of my head, I'd say save in DIF (data interchange format)
then use the utilities supplied by Lotus to convert to WK1 format.

The way you do this largely depends on the version of 1-2-3 you're
using.

CC65 running on Unix? How?
I, too, would be interested in an X Atari emulator, even though right
now I can only run X on the machines at school, and the Atari stuff is
at home.

I hate to take away from the discussion of how useful the Atari still
is, but I have to mention that one of the most popular games in this
computer lab full of HP Apollo workstations running HP-UX and
X-Windows is... Boulderdash (aka xbd). Old games for old computers
don't die, they just get ported. :-)

> requested this information.

I'm interested in the technical specs. of FlickerTerm80 - ie, how it handles 80 columns.

So far, the four ways I know of include:

320 x 200 x 2 w/ 4x8 characters (standard - like in Term80, etc.)
640 x 200 x 2 w/ 8x8 characters (XEP80 hardware - like used by BobTerm)
320 x 200 x 2 w/ 4x8 characters (fast scroll - by Itay Chamiel)
320 x 200 x 2 w/ 4x8 characters (low RAM - never done - my idea of a horizontally "APAC"'d 40x24 text screen)

How does yours work?

When writing to request catalogs,
it's always a good idea to include
a Self-Addressed Stamped Envelope.

When writing to foreign firms, try enclosing
a couple of International Reply Coupons (IRC's).

1151. 360K DS/DD and 720K 5.25" drives for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 20:19:14 UTC
From: cohen@gomez.phys.virginia.edu
Message-ID: <0097B79F.18533B60.31520@GOMEZ.PHYS.VIRGINIA.EDU>
Source record: 102582

I have a couple of Double sided/Double Density 360K (IBM compatible)
full height floppy drives. These were used in IBM PC&XT, also usable
in other computers such as Radio Shack/Tandy, Atari with the right
disk interface, Texas Instruments, CP/M systems, etc. These are the standard
Tandon TM-100-2A drives. Asking $10 each.

I also have 5.25" 720K (80-track) floppy drives; they use regular DS/DD
diskettes to provide storage of 720K per diskette. Asking $40 for a pair.

If interested, and can use these, please make offer. I am hoping to
get more than $10 each. All are in good working condition.
Please e-mail to COHEN@GOMEZ.PHYS.VIRGINIA.EDU
Thanks!

1152. MULE program requested

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 21:27:43 UTC
From: svillase@dcc.dcc.uchile.cl
Message-ID: <1994Mar15.212743.25780@dcc.uchile.cl>
Source record: 102583

I need the MULE program (the C source code) for transfering programs
between the PC and an Atari 1050 disk drive.
I had it for a little time, but I lost it... :(

Can anybody e-mail me it?

1153. Digital PC joystick w/atari joystick

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-15 22:03:46 UTC
From: svillase@dcc.dcc.uchile.cl
Message-ID: <1994Mar15.220346.13763@dcc.uchile.cl>
Source record: 102584

I'm interested on building a digital joystick for my PC from an old
Atari joystick, 'cause there is no comparison on playing arcade games.
If anybody can e-mail me some specs or better a circuit diagram, I
would appreciate it.

Greetings from Chile

>adequate, and the second was was surely powerful enough.
>Then you say you don't waste a lot of money on things you don't need.
>
>

Simple really, the job I bid on and won required that the output be from
a mac and done under owner choice of software...Ready,Set,Go... I have seen
ventura for the IBM and found it wanting...

Sorry about not being clear

Mike

> horizontally "APAC"'d 40x24 text screen)
>
>How does yours work?

That last way. Imagine what it would look like and think about the name
"FlickerTerm". I had the same idea, a short while after Clay himself did
(he just didn't tell anyone so I thought it was original), so I got out my
list of 6502 opcodes and made a USR string to flicker the screen. Then I
made two fonts: one for left side, one for right side. It took a while, I
had to use DATA statements since I didn't have an editor either. I wrote
some routines in BASIC, and successfully displayed a FlickerScreen full of
text. It was quick and dirty but it worked. I use four-bit characters
instead of the 3-bit characters everyone else likes to use. In fact, most
Commodore 80-column term programs have the option, or built-in standard,
for four-bit-wide 80 column characters and many C= users prefer it, as do I.

You could probably throw something togetrher to see what it would be like.
I did it, and I don't even have an ML monitor or font editor.

In article <CMpMF4.Bp3@cbfsb.cb.att.com> rdell@cbnewsf.cb.att.com (richard.b.dell) writes:
>
>ago. The last thing to go is the publications. The only commercial ventures
>still ongoing are what I would call a "labor of love" on the part of the
>proprietors. The Atari 8bit does have somewhat of an advantage in the

wrong... All you need do is read the postings here to see the error of the
above... DJG comes to mind, the developer of the Yorke... PPP in Germany
and the list goes on... FTe, CSS, CTH, ATV, Best, B&C.... how about
K-products and the Pro-Board...

>much product does anyone think they can move when the subscription interest
>in Atari Classics was at its peak of about 500, and I understand (correct me
>please Ben) renewals are running only about 50 percent of that.

By that do you mean to say that there are only 500 8bit supporters left?
True, not everyone wanted to support the mag, so what. Guess you could say
it's the consumers passing judgment on a product, just like it happens every
day in the real world. But so what... If a product or service is good ad
is what the consumer wants, he'll support it. Now, I know you dont mean
there are only 500 8biters left, but just because one venture didn't hit
the mark doesn't make the whole idea wrong. As I said in my org. post, things
are done for profit, AC's profit is to be able to pay it's bill and pay
it's writers as well and deliver a quality product. If AC was a pure labor
of love, it'd be put out for free much like Znet...or if in printed form,
much like many of the FanZines...and costs to the user would be only the
cost of production...(about $3.50 per issue). No, as Ben has said many
times before, AC is a buisness and must stand on its own feet, if not
supported, it'll go away...

>It seems to me that a lot of the piracy debate may be sour grapes left over
>from the rapid decline of the Atari 800 series due primarily to marketplace
>competition from the Commodore 64. Many companies undoubtedly saw their sales
>go away very quickly, and saw piracy as a major reason. This was not the
>primary reason. The primary reason was the loss of market share of the Atari
>computers in general.

Agreed. I also agree with most of what you had to say reguarding hardware...
many folk would rather upgrade to a newer system than spend the same monies
on the 8bit...However, if a product is developed that the comunity as a
whole wants, it will be supported... Bob Whooly(sp?)'s IDE interface may
be the trick and just may be able to produced for less than $50 per unit...
(maybe a lot less)

>Today we are in a much different situation. There is an extremely small
>marketplace, and any producer had better be aware of that. More over, be

>as strongly aware that your competition is not piracy, but the used marketplace.

That's why folk like Nick Kennedy went for a nich market...and he's getting support from users...

>Yes. Definitely. Do I feel guilty about this? No, that is the reality
>of the marketplace. Competition is what one has to live with ... and, in my
>opinion the competition is not piracy, but the used marketplace.

and you shouldn't, shopping for the best price is something consumers do...any one getting into retail knows this and plans for it...

>How can a commercial vendor survive trying to sell to someone like me? And
>I am not being unreasonable, I am just strongly aware of the used marketplace.
>And THAT is the competition.

Hay, you're a market force... If vendors want your buisness, they have to attract you with something you can't get elsewhere, or something in a condition you can't get elesewhere. Is price of software fair? Books and Mags fair? Its market forces that decided such things... And that gets to the root of everything...You either support it or lose it.

I'm not saying anything new here, folks are going to do what they feel they have to do. Nothing you, Chris or myself has to say will change that. This issue has been beaten to death.

I don't know about you, but I'm ready to move on to something else...like, how DO you program for a cart? Do you assemble into memory then save the 8 or 16K file with a $0000 org?

Anyway, Take care

Mike

Hi,

Anyone out there remember SSI's "Kampfgruppe"? I sold by 8-bit 5 years ago,
but recently bought another, and am trying to get some software back. Anyone
got a (original) copy for sale? Any format, but I'd prefer 8-bit Atari.

Cheers
bnp@waikato.ac.nz

Well, I can't completely answer your question since I don't have time to tinker with mine much any more. The basic idea is why use a chainsaw when an axe would do? Some people like myself are poor (I'm a student <g>), and can't afford the latest in aeverything, and if what you have works, why spend money you don't have. I used to run a BBS on my 8-bit (even though I used my ST more), and when my ST was out of commission for a while, I used the 8-bit again.

When I moved off to school last summer, the people I was living with didn't want to me to bring a computer cause they were worried about power consumption (strange, but true). The trouble was that I NEEDED a computer. So, I needed something that was easy to set up and take down to put away. The 8-bit fit the bill perfectly. I already had a TV, so I all needed was to put the disk drive under the TV cart and leave it hooked up with a P:R: connection and modem attached. When I needed the computer, pull out the 130XE keyboard, plug in the power, SIO, and TV cables, plug in the phone line to the modem, and I was ready to go. I could use it to access the VAX at school all I needed with K65.

Now that I'm living somewhere else, I have my ST and use it all the time. BUT, by the same token, I don't have a Falcon or a TT or even an STe, just one of the original 1985 model STf with 1 Meg of memory. Sure, it may not be the fastest thing with the best graphics and such, but it allows me to access the VAX to do homework, and type up reports and such. If it does what I need, why try to get a PC compatible or whatever? <G> I can't afford a Porchse, but my old beat up Chevy sure gets me where I want to go! <hehe>

Maybe I can add some flesh to the emulator argument. Though I do have an 800XL and 1050, my main interest has always been in Sinclair micros. I recently agreed to be the UK reg site for a ZX Spectrum Emulator. I was not expecting to make money, but I have because so many people are buying it. Several thousand last time we chexked. Now it it works for this machine, why not the Atari?

Hello,

Just wondered if anyone out there could advise me on how to archive my many "boot disk" games that I've accumulated over the past 14 years onto my HD (I use the ICD 1 meg MIO, which has a SCSI HD interface, which I've connected to a 30meg Seagate).

There must be some way to take my original disk and convert it into either a "program.com" or "program.exe" file. If anyone could point me in the right direction, I'd appreciate it.

Note! I'm not asking to "pirate" anything, just want to backup what I already have onto my HD, which will make playing sessions much more enjoyable.

Thanks,

Bill, 14yr. Atari 8bit veteran .. with 7 Atari Classic 8 bit computers!

(Bill asks how to put his boot disks onto his harddrive.)
You can't. Unless there is a way to partition your hardrive into
one partition for a boot disk and sector copy it to the hardrive.
I'm sure you can't do this. A few of your disks may be around
as cracked file versions. The rest, nope, don't think you can
do it. Remember that most those disks you have are copy
protected to boot, so even if you could change them into
a file, you would have to have the disk to get past the
copy protection. A primary reason for having boot disks
instead of file versions of games and stuff is to make
the copy protection harder to crack.

What you could do is using Bob Puff's DISKCOMM to convert your boot disks
into files. Then you could simply copy the diskimages anywhere on your HD.

That's good for backup reasons as you can't boot from a .DCM file.

Well, why not? I think it wouldn't be too hard to write a utility to
actually boot from .DCM files. All you need to know are some details
about how DISKCOMM works. This is obviously something nobody seems to know
except Bob Puff himself. At least I haven't seen a response to
queries about the .DCM format lately. It seems to be a very good kept
secret in the Atari world.

>Hey great! IA8 is back up then?

I don't think so. I also got this digest today, but look at the messages
inside: they're out of date in a major way. I suppose these were messages
sent to the listeserver directly, they don't seem to have been crossposted
from c.s.a.8.

This makes me think of something. IA8 is only dead because it doesn't get
any messages from c.s.a.8., the server itself appeares to be alive.
What would happen if somebody captured some postings from c.s.a.8.
and mailed them to Info-Atari8@naucse.cse.nau.edu ?

Should I try it?

>Wouldn't it be hot if we could slap one of these single-chip Ethernet chips

* dream mode on *

This would be great indeed. The major problem, as always, would be the
software. How about a TCP/IP protocol handler for the 8-bit?
Just imagine: you could do all those nice things like Telnet and FTP
with the 8-bit.

* dream mode off *

Brent Knab asked if you could use a 24-pin Dm printer with an XL.
The answer is YES, I've been using an Epson L-1000 24-pin DM printer with my 800XL since 1989. Works GREAT for text.

Graphics is a different story. Epson changed their firmware with the 24-pin printers, so if you try to print, say, a Print Shop icon with it, it comes out elongated. This is called "aspect ratio distortion". Just before Innovative Concepts went down the tubes they brought out several 24-pin dribers for Print Shop (actually by Jim Steinbrecher of Sector One Computers). I reviewed one of these in Current Notes, I think Feb. (???) 1991 or thereabouts.

Even with one one of these drivers, it's naive to assume you'll get a nice hi-rez graphic dump. Instead, all the drivers did was correct the aspect ratio problem & employ all 24 pins to ensure a thorough fill of the graphic. BUT... the graphics still come out blocky-looking! However, the big coarse blocks of the graphics are very neatly filled in, so you get big black blocks.

My opinion, for graphics purposes, you're beter off with a cheapie 9-pin DM printer. All the old software was designed for those so you don't need any special drivers. And the 9-pin graphics look just as good.

For text, however, a 24-pin printer is in my book a "poor man's laser". The main reason I haven't bought a laser printer is because a laser will yield only slightly better text quality over the 24-pin DM but with greater hassle/expense. I do virtually all of AC's correspondence with this printer & it looks entirely professional. I can do continuous-formfeed paper or individual letterhead sheets (lasers only accept cutsheet paper). I know it probably isn't "cool" any more to have a crummy old DM printer, but they last forever & perform extremely well. I re-ink my ribbons which is a zillion times cheaper than laser toner-refills, & I keep a spare dothead on hand in case my present one croaks (it's still going strong after 5 years).

Bottom line: if you do lots of text-type things, a 24-pin DM is best buy you can make. But if you're a graphics phreak, forget it, hang onto that old 9-pin printer. The old 9-pin Epsons were built like battleships & last forever.

Well I saw Jim Hague's post in which he suggested Ben Poehland was still seriously using an 8-bit. And Jim King responded with a list of impressive hardware he uses in his 8-bit system. All well & good.
I don't want to scandalize anyone, but the Classic Atari is only one of several hardware platforms I actually use. Here at work I use a Mac IIci. And at home I've an ST & a whole closet full of IBMs. I still PREFER my old 800XL, mostly because I've been using it for 10 years & the darn thing has grown on me. I would use the XL for everything, if the only the software existed for the stuff I now need a computer for.

Wordprocessing, telecom & databases are still things I can do just as well on my 8-bit as on any other machine. It's professional graphics applications that are lacking.

For example, I can't use my XL to draw the molecular structure of vitamin B-12. Maybe not many 8-bitters want to do that (these days anyway). So I use CHEMDRAW on my Mac... NOTHING can beat it. I had an XL on my desk here at work for 5 years, got the Guvermint to pay for it by taking a nice tax deduction. But the day came when my Boss-Man commanded that I must be able to print computer-generated chemical structures or I'd have to get rid of that "damn Atari video-game thing" (it was NOT cool to have ANYTHING Atari on your desk when you work in Corporate America). So, after 5 faithful years, the Atari came home (it was depreciated anyway), to be replaced by a fancy $5,000 Mac-thing whose only advantage over the ancient Atari was that it could draw chemical structures. (At least THEY paid for it, not me!)

I've always wanted to draw camera-ready schematics with my 8-bit. Bought all the progs (there are 3 of them) for the XL that purport to let you do it: Graphic Master, Circuit Database, and Schematic Designer. All of them crap. Strictly the work of amateur programmers who never HAD to use a computer-generated electronic schematic in a REAL magazine. I moved to other platforms: got Circuit Maker for the ST (more crap) & Circuit Maker for the MAC (crap ad nauseum). Plus another Mac prog, Electronic Workbench-- crap continued. So now I'm looking at circuit drawing progs for the IBM. Got one from JDR, can't remember the name, no matter it's crap. Got a line on two more, haven't had time to look into them yet. Tho I will say, schematic progs for the PC DO seem abundant.....

What's the bottom line? Simply this: computer HARDWARE doesn't mean diddly-squat. I've updated my outmoded Classic Atari so that it's hardware is, as far as my needs are concerned, equivalent to any of the fancy Mac & PC junk you see out there. BUT... I can't get the SOFTWARE I want for my 8-bit.
So I'm forced to evaluate other hardware platforms.

IT IS THE AVAILABILITY OF SOFTWARE THAT MAKES OR BREAKS ANY COMPUTER. PERIOD.

Hardware-wise the older PC's- 8086/286/386, are hardware disasters. There are SURELY better machines than Intel. BUT the mainstream software market decided to support the Intel/IBM/MSDOS architecture, kludge tho it may be. It was these thousands of third-party developers who were ultimately responsible for making a mediocre hardware design into the exalted altar of Big Blue worship it has become today. The growth of the PC market was never related to the quality of the hardware, which started out as junk (OK, the 486 & 586 MIGHT almost be decent computers, but how long did it take?).

The Atari 8-bits were better hardware than than the Commodores, yet the Commodores outsold the Ataris 3:1 & you can still find occasional commercial software for them. The Apple II is still around. But there has been NO release of commercial software for the Classic Atari since 1991. In a market that is software-driven, the lack of high-quality new software for the Classic Atari 8bit is our death knell. Sure, you can maybe find some PD or shareware things still being produced. And much of it is amateurish, since most of the people who really have time to program stuff are mostly high school or college kids whose efforts lack the telltale hand of experience. I'm not knocking those people, they are our lifeline, but neither can our market survive on such meager fare. You can get decent wordprocessors/databases/telecom progs for ANY computer these days, all that stuff is standard fare. What I keep wondering is, what happens when I FINALLY find that schematic-drawing program I've been seeking these past 10 years? Likely, it will be a PC program. And the folks who produced CHEMDRAW for the Mac are now working on a version for the PC. And there's LOTS of wordprocessors/databases/telecom progs for the PC. Once I get programs that draw schematics & chemical structures, as well as all the ordinary stuff, I'll probaably end up switching over to that hardware platform as well. And my faithful Atari will become expendable. Not because it's an inferior machine. But just because there's no software market for it any more.

That really sucks, huh?

Of course, I'm the sort of fellow who still haunts record shops looking for LP's. You know, large black disks, you play them on an ancient thing called a "turntable". Sound quality may be a little noisy com[pared to those shiny little Japanese silver things, but at least the soundstage depth of a full orchestra was faithfully captured... something you'll never get from a CD. Just goes to show, hardware doesn't mean diddly, it's what the software producers decide to support....

>years, I can tell you I do it for the PROFIT...feeling good don't pay
>the bills. You go take the above line and tell it to the likes of Bill
>Gates, Steve Jobs, Bill Atakins etc...

Yeah, Bill Gates sure knows about profit. He has no other reasons for producing software, and that's why his stuff is hideously slow and bloated. But who cares as long as he made a profit from it? Good ol' American greed.

No Thanks. I'm grateful that not everyone in this country feels that way, even though it's sad that most people do. There's plenty of people out there, myself included, that don't use profit as their motivation. And using programs written by these people is a real dream. What a difference.

I left On-Line Systems while making $30,000 per *month*, because I was disgusted with the greed that was starting to control that business. As soon as profit became their only concern, I was out of there. Yeah, I have a much harder time paying the bills these days, and I don't have all the exotic goodies I used to, but I'm more comfortable inside, and that's a lot more important than money. I know people like you won't understand this, but like I said, thank goodness there are some people out there that don't put money as their number one priority.

Ask Ben Poehland if he started Atari Classics in order to make a profit.

With Ben Poehland's comments, this thread has started to take a most interesting turn.

My reason for still believing in the 8-bit machines is not because I think them superior to modern systems. I admire the hardware of an 800, and all that, but there have been other good designs through the years.

What keeps me hooked is that Atari classic computers come from a time when simplicity was an attainable goal. A small individual or company could directly challenge products from Atari itself and users could choose alternative programs without having to throw out their current base of software. I hope I am getting this point across; I realize I'm not being very clear.

In short, I would much rather buy products from smaller in-touch companies than marketing behemoths. I would rather feel that I could control my machine rather than feeling its something I lease and have to pay software access fees for.

I've given serious thought to writing professional quality software for the 8-bit machines. Heck, I write 6502 code for a living (really) so it's not that far-fetched. But it's a hard thing to commit to, of course. I could write simple, low-key software for the PC just as easily. And it would be easier for users not to have to deal with painfully slow disk access times, unfortunately.

Much as I appreciate the classic 8-bit movement, and the emergence of Atari Classics, I don't know if it's really worth it.

|
| Jean-Luc

Back in the old days, Atari sold technical reference notes for their Atari 8-bit computers. It consisted of 3 documents: Operating System Manual, Operating System Source and Hardware Manual. At the time, the cost was $29.95 (minus tax). They also sold the 1200XL addendum ($4.95) and De Re Atari ($??). I don't think they'll still have those for sale.

Your best bet is to ask for it at user's groups, Atari BBS's or here at Usenet.

Good luck.

>trackball (in trackball mode) acted identically to the ST mouse, except
>for the fire buttons.

This isn't the case. I tried to use the trackball on my ST in place of the mouse, and it didn't work. The only way I got it to work was by putting it in joystick mode, and using an ST program that allowed the joystick to be used like a mouse.

I did try the driving controller on Missle Command in trackball mode, and it seems as if the trackball might act like a pair of driving controllers.

BTW, sorry if this article shows up twice. I posted a reply, and apparently the original had a followup to rec.games.atari.classic (or whatever <g>), and since the original question came up in here and I don't read the other group... It think it was only posted there.

The question is, has anyone patched a version for the 8-bit? I heard that it does nasty things when used with a hard drive (leaving files open and such).

There is a big difference between profit and greed, and though you may no
believe me, I do know what you mean. My buisness is run for profit, true,
but I'm fair... Thats how I stay in buisness, it's how I keep my customere
base, its why I say the things I say. The main reason I work for myself is
because I got sick and tired of watching people get taken...and yes I'm
happier with myself for it. Gates was a bad example... Still, I stand by
my org. post, i.e. show someone how they'll profit from a venture, and you'll
likely see that venture come to pass...

>
>Ask Ben Poehland if he started Atari Classics in order to make a profit.

In some sence, yes... In this case, a working venture that would pay it's
own bills and stand on it's own legs...something he could call his own yet
share with everyone...

Apparently it works. Mike mailed a couple of messages to the digest, thanks
for this!

Now that we know the way to make IA8 going again we should agree on how
to do it on a regular basis. Mike, will you do it for us?

I know something like this can be automated. I've heared that the
'tin' newsreader on Unix systems supports automated mailings from newsgroups
to an E-mail address. Mike, do you have 'tin' installed?

>A 65802 running standard code in 8-bit emualation mode will yield 0% increase
>in throughput.

If you mean standard 6502 code, that's true. But it is possible to get slight improvements in speed, and substantial improvements in code flexibility even when running the 65802 in 8 bit emulation mode. You'll get a lot of extra opcodes, stack relative addressing, all the hooks to write fully relocatable code, and more. And none of this would require any changes to the OS.

>A 65802 running MODIFIED 16-bit internal code of existing programs will yield
>a good increase in throughput depending on the application.
>
>A 65802 running in 16-bit internal mode WILL REQUIRE A CUSTOM OS!

I think a 65802 could run in 16 bit mode with almost no changes to the OS. The only thing that would have to change for sure, would be the interrupt drivers.

> In addition, the CUSTOM OS will need a switch to go from 8-bit to 16
>mode, either the OS will be banked, or it will be 2 ROM's stacked.

You could do it with one OS. Native 16 bit mode uses a completely new set of interrupt vectors. The emulation mode vectors could use standard interrupt routines for 100% compatability, while the native mode vectors would be set up to preserve 16 bit registers and such. No hardware switch would be needed, since software switching modes at the CPU level would automatically switch to the 16 bit int routines.

>And I believe John's MAE will assemble for 65802 and 65816s

I don't have the Tech Manual here, but you would have to assemble
for the correct cartridge slot (I believe the left slot MIGHT be
$A000, and the right slot $8000, or something like that) AND
you have to provide some operating system hooks for initialization
and such (jump instructions or address vectors, can't remeber which)
at the begining or end of the address space. It's all in the Tech
Manual for the 800.

Source record: 102520

(Discussion about motives for remaining 8-bit supporters.)
Ben Poehland has not found AC profitable money wise, I'm sure.
His liking or love of the platform, the users, the community
and his ego as the OWNER of the only 8-bit magazine(maybe
Current Notes.) is a major motivator. The machine is a fantastic
machine and stands by itself. It is just a neat machine and
a fair number of people stick with it, which makes a small
market for the few remaining people that hope to either
make a living or part of a living from that market (CSS, FTe,
Am. Tech. Vis, B&C, San Jose, etc.). I agree that love of
the machine motivating people like J. Harris and Bill Wilkinson
to keep producing for the platform will not work. On the other
hand, a dedication to the machine makes a market that can still
support some investment. Newell industries is cut way back,
Mr. Newell has a 'day job' to put meals on the table. The
concept that people like Newell and Puff will continue
investing in the 8-bit without sales is fallacious. Probably
about half the business the few remaining 8-bit companies
get is from each other.

From what little I've looked at, seems not suppling and org address defaults
to the left cart space first, the last 6 bytes seem to be the key to getting
the cart to init, $BFFE sticks in my mind for some reason. I'm going to
have to try compiling to memory, save the contents, (8k should be no prob),
and try putting something on a cart. Hmmmm sound like a plan.

1191. News Digests...

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-17 14:24:39 UTC
From: snyder10@convex1.tcs.tulane.edu
Message-ID: <2m9p77$t54@news.cs.tulane.edu>
Source record: 102522

Okay folks, here's the deal. Until we can get the newsfeeds turned on again at the Digest site, I can get the system to output digests by sending a capture buffer from Comp.sys.atari.8bit once or twice a day. The downside is tha the digests will not have a table of contents as they did in the old days...this is because there will only be one subject per packet of mail. I'm looking at several options that would allow me to forward each posting so as to include the proper subject. If it looks like it works for most people I'll continue to send the packets... If not, I can hold off until (and if ever) we get the news feeds running again.

Let me know.

When I owned a 130XE, the only two programs that I had that used the extra memory were a 1-pass disk copier and a ramdisk. I think that DOS 2.5 loaded into upper memory, also, but I can't recall. Anyway, I see posts with people that have 256K or 1M in their 8 bit, and it leads me to ask... What do you use all of that memory for? What software supports more than 64K?

And, my second question is,
how fast is sio2pc compared to, say, an 810 drive.

Well Jay,

I use all that extra RAM in my 1 meg 1200xl as a huge RAMDISK.
Since this particular system is on 24hrs a day, and has its own
"battery back-up" (making it non-volatile), it is very handy.
This system is used on my Amateur Radio "Packet Radio" system,
sort of like running a bbs over the air waves ... no connect
charges! ;)

To any other hams out there, my packet address is:

KB8EB @ WA8BXN.OH.USA.NA

BTW, my little Atari computers have a better record of NOT
going "down" than do the guys using all those fancy "Clones"!

Sure, I still use 8-bits. They are being fitted with RS-485 network
interfaces and custom ROM carts to allow them to act as dedicated I/O
terminals for a home automation system.

And no, I don't play games on them anymore; after playing DOOM with
three other guys via a Novell network, everything else just kinda pales
by comparison... ;-)

I never thought I'd do this, but marriage makes you do strange things.
I have an Atari 800 and an Atari 800XL both in nonworking order. They're
yours for the taking! Send me a note and we'll arrange where and
when to do transfer of ownership.

I'm not sure what's wrong with the 800, but the 800XL has a bad ROM
and a bad keyboard. I'm not sure what the power supply situation is,
either.

1198. Atari Vs Amiga

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-18 00:38:05 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <2mat5d$lbq@dux.dundee.ac.uk>
Source record: 102529

Last year I sold my XL and replaced it with an amiga, sure the Amiga is
faster, has more powerful commercial software and has a fairly nice
windows/multitasking enviroment.

but overall the Atari wins hands down on ease of use and quality of PD
software. Take for examples textpro and an amiga counterpart text engine.
Text engines code is X times bigger but has a fraction of the facilities,
TE for example does have 80 col and spell check but its quite easy to get a PD
spell checker. But the one thing text engine doesnt have is justification, hmmm!

likewise I recenly got a cover disk version of Protext (4.3), it doesnt
even include double line spacing!!

Overall the Amiga is "technically" superior, but the quality of programming
in terms of size/facilities is a lot lower. If textpro can offer so much
for around 20k and text engine so little for several hundred K, then
perhaps some serious looking should be done at the present "memory expansion"
race!!

: believe American Techni-vision sells. It has a great deal of hardware
: and software specs for the communications over the SIO bus.

Ugh, I wasn't sure if they still carried it, so I checked into it anyway...
They USED to, but no longer carry it. They have a couple pages of manuals:
Atari XL Users Handbook, Mapping the Atari, among others... IT'S WORTH IT TO
ASK THEM SPECIFICALLY FOR A TITLE, even if it's not in a current catalog.
Many times they'll have new or discontinued products but in EXTREMELY low
quantities which don't warrant making a catalog revision to add a product.

Jim, do you think you might be able to send a copy of the sio2pc docs to
umich (the Atari FTP archive) as well? (or is it already there??? I saw
something about sio??? in the Util area I think... I'll have to check)

I checked Lotus 1-2-3 rel. 2.2 at work today, and its translate program has an
option to translate from Visicalc to 1-2-3, as well as from DIF to 1-2-3.
I have 1-2-3 rel. 4 for Windows, and it won't read VC or DIF files directly,
but it comes with the translate program from rel. 3 (for DOS) which will
convert DIF files (but not VC files) to WK3 files.

The problem with only using DIF is that you can not port a spreadsheet over, only the data (results). While SynCalc stored a spreadsheet as a spreadsheet, VisiCalc stored it as a series of commands. There might be a different format for some in Lotus, and the macros may not be stored as as plain ascii commands. But, converting a visicalc file to a series of macro instructions (if you lack the import utility), MIGHT do it.

It should be possible for those with T816 chips--
A friend of mine has an Apple IIgs (with 65816), and he has a version of Unix
on it. Apparently TCP/IP is in the works for it.

Memory would be a major problem. I've heard of 1 Meg Atari systems, but Unix
would require more than that, and more than 48K of RAM would have to be
addressable at once. Hard disk space might also be a problem, but that should
be more easily solved -- we are talking about a replacement for DOS here, and
hard drives under 100M are cheap these days.

I wonder how much you'd have to take out before it would fall into the
realm of possibility.
Yet another project to float around the back of my mind. I bet that Unix port
of CC65 would be useful here.

You'd rather have a box full of floppies to flip through than have it all a keystroke away on the hard drive?
The main reason software has to be "installed" these days is that it's just too big to fit on one floppy, and people don't like to flip floppies around.
(Although I wish I had a dollar for everyone I've talked to who didn't know the difference between their RAM and their hard drive!)
Whether or not those programs could be squeezed into smaller space is another issue - the fact is, the programmers don't have to optimize for space, so they don't, optimizing for speed instead.

> All of the first age of computers, the Apple II, the C=64, the TI/994A,

>FAILURES as far as they are concerned, at capturing any of the consumer
>market.

They also couldn't do as much. It's a fact that the more powerful something is, the more complicated it is.
I'm not so sure about "simpler hardware to work with and setup", either.
Let's see, not including printers, modems, mice, and joysticks:
My 2-floppy Atari system has 5 cases (including P:R: connection) and four power switches to turn on and off in the right order, plus 7 wires going various places.
The 486 I'm using (also 2 floppies, plus a 212M hard drive) has 3 cases (including keyboard), 2 power switches (no special order to remember), and 4 wires.
Which sounds simpler to you?

The cartridges were easier to work with, but they had limited storage capacity. Now CD-ROMs have the convenience (though not the speed) of cartridges without the space problems.
I wonder if the value of X-Wing compared to Star Raiders is anywhere near their size ratio (which I'm guessing is at least 3000 to 1). I seriously doubt it (but then, I haven't actually played X-Wing yet, just watched).

>Which sounds simpler to you?

kin I jump in here too? <G>

The 130xe I'm using right now fits all in a minitower case, has two high dens
floppies (5.25 & 3.5) as well as a striped 1050 (on it own supply mtd in the
case), built in (striped) Intel modem (by striped I mean no case) and a
20 meg drive...I've justgotten an 80meger but havn'tfound the time to
put it in yet. Only three wires, one to the printer, one to the keyboard
(TransKey) and one to the wall, only one switch (I've a TKfreeze installed
to delay boot up to allow for the hard drive to spin up to speed)...oh yeah,
make that 4 wires, one to the monitor...does the phone line in count? rats...
okay, 5, but still only one switch <G>

I even went out and got a number of Atari logos from Best and stuck 'em on the
keyboard and case...

True, it's alot more work to setup than an IBM, but it really is a show piece
when someone walks into my office!

The full docs and spec's for building SIO2pc are at the archive, however, I believe they are in IBM format and I think Ziped... Oddly, I just got the newest version of the software today, If you'd like, I'll convert the docs to Atari format and send 'em to the archives as a seperate file.

Yeah, DDIII has been out for some time, as a matter of fact, there have been
a number of articles describing the various functions of DDIII in
Atari Classics. Also, there are a number of macros floating around for
TextPro that help you config a file with DDIII

Anyway, DDIII is for sale by the author

Hi all,

James does not have access to email.

A few people have asked if I can ask him some questions.

So, if you have any questions, post or email them to me. I will wait till Wednesday and ask him all your questions at once. So get them to me by Wednesday!

SuperDOS will get to the archive soon (I promise). Will the 8 bit unarcs work if I use that old pkarc.exe program to my PC to arc it?

Still no word from any Aussies. There seems to be a thread "Where Dem Aussies" but I don't think much of it has arrived down here yet.

I guess I am the last of the species reading c.s.a.8b. :(

The Gemulator is a combination hardware/software product by Darek Mihocka of Branch Always Software that installs in a PC and allows it to run Atari ST software. It's a commercial product which sells for $229, I think, and comes complete with a set of TOS 2.06 ROMs. It works very well, given you have a sufficiently fast pc to run it on. It's not the best choice if all you want it for is to run ST games and it does not yet support MIDI but for most other apps, it's certainly a viable option for some, IMHO.

For more info, you can send email to the author at darekm@microsoft.com .

Also be advised that an individual just recently posted a Gemulator for sale at $150 in the comp.sys.atari.st newsgroup.

1219. Atari Emulator/ X-Windows-- almost ready-- need help

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-19 00:04:45 UTC
From: feb6399@ultb.isc.rit.edu
Message-ID: <1994Mar19.000445.14890@ultb.isc.rit.edu>
Source record: 102550

HELP!

For those of you who were wondering what happened to me---
Well, I actually managed to find a little time to work some more on
my Atari Emulator for Xwindows (which should be incredibly easy to port
to DOS as well as other platforms) I've sped it up a lot and fixed a
ton of bugs. However, I'm still plagued with an odd CPU bug, and I
don't think it's from the decimal mode stuff anymore-- or if it is,
I can't figure out where it's going wrong.

I did, however, track it down to one very simple situation that has
the bug-- Atari BASIC. Anything dealing with printing numbers causes
it. So, here's what I need. (and once this is fixed, I just need to
clean up the code a bit, and I'll release it at last!)

I need someone to send me a 6502 debugging trace of what happens
after you enter the following line from Atari Basic:
PRINT 1

Instead of getting "1", I get:
1.00000000**********
where the "*"s represent hearts. and it goes on forever, occasionally
repeating the number.

For the sake of consistency, try not to do anything else in basic
first-- just type "PRINT 1".
By the way, I don't remember which ROM's I successfully read to get
the Basic cart-- so it could be anything from A - C.

If it helps anyone figure it out, the first place in the Basic
cart it returns to (from the e63c: RTS instruction) is bdf7 (JMP bcbb)
from there it goes to JSR bd00, and then JSR bcaf
I'm using the Atari 800 Rev B OS Roms also.

I need to see the instructions executed and the CPU registers and flags
at each step after return is hit for "PRINT 1". If possible, seeing
any memory modifications would be useful as well.

Thanks for the help. (and please do help if you can-- so I can
finally release this thing-- I've spent many long hours trying to find
the bug, and can't afford to spare any more time)

- Frank

Just got through building a SIO2PC last night. Nick Kennedy gave Mike of FTE an updated circuit & software. The new one only uses 1 IC & is IMO, very very nice. About 3X the speed of a stock drive & seems to be about as fast as a US Doubler. My only gripe is SDX could be better supported, but it looks like that is in the works. It does all the goodies you'd expect & more. You can even swap IBM disk images on the fly: Stuff like "insert disk 2 side 2" can be done by eXchanging ramdisk with the IBM keyboard.

>Hey! I need a null-modem cable to connect the 850 to a PC.
>Who knows the pinouts???

I'm sort of guessing these cross connections as I look at a conversion chart I made long ago. If this doesn't work, check a hardware reference guide - null-modem wiring charts are reasonably common.

850 names std. 9-pin std. 25-pin
--- ------- ---------- -----------
essential lines:
3 XMT-RCV 2 3
4 RCV-XMT 3 2
5 GND 5 7
"sometimes necessary" lines:
6 DSR-DTR 4 20
1 DTR-DSR 6 6
7 RTS-CTS 8 5
8 CTS-RTS 7 4

>Who knows the software to use on both sides?

You should be able to use any communications software on both sides. As long as both can use the same file transfer protocol (Kermit and Xmodem are the most likely to be common), there shouldn't be a problem.

I think that once you have the wires connected and the software running (remember to set the same baud rate on both ends - probably 9600 or 19.2k), you should be able to see the typing of one computer on the other one. Set Half-duplex (a.k.a. "local echo") on so you can see your typing locally. Start one computer sending, then the other one receiving, and watch the fun.

1226. Taking the Plunge?!?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-19 06:14:39 UTC
From: telliott@crashb.megalith.miami.fl.us
Message-ID: <telliott.03jv@crashb.megalith.miami.fl.us>
Source record: 102554

I'm thinking about taking the plunge into the world of Atari 8-bit computers... The reason is that I've been a faithful C=64/128 owner for the past 11 years, and I feel that I need to switch platforms to broaden my 8-bit computing horizons. (Of course, I use IBM klone crap at work and home, but my C=64 has stolen my computing heart!)
So, I have aplenty of questions:

What's the difference between an 800xl, 1200something, 200whatever, it looks like an alphabet soup. The ideal configuration I am looking for is a standard Atari with 64k of memory, like the C=64. If there's a machine similar to the C=128, I would also like that, too!

Are there any books and magazines still in circulation where I can pick up and try to learn the ropes of Atari 8 bits? The only remotely close documentation I have on Atari 8 bits is the book, Second Book of Machine Language by Richard Mansfield. Even that book skewed considerably towards the C=64.

Oh, is there anything else I should know? For all of my years with C=64, I feel embarrased to say that I hardly know nothing about its relative in the 6502 family, the Atari...

Secondly, I enjoyed a posting by some chemical engineer where he used his machine, always in eternal search for some circuit board program, etc. He said it best- Software is what makes the machine. Granted, C=64 is nearly dead, software wise. Atari ST and Amigas look all but dead. Mac's are surprisingly hanging in there, but how long? And despite all of its faults, the intel 80x86 chips reign supreme. Even still, I still come home from work, and power up my C=128 and enjoy the thrill of computing mano a mano with the 8502 microprocessor, which I would not be able to do on an intel 80x86 crap.

Enough musings, and I hope you vets won't give me a rude welcahme... ;)
Todd

>There is a big difference between profit and greed, and though you may no
>believe me, I do know what you mean. My buisness is run for profit, true,
>but I'm fair...

My point was apparently lost, due to the careless use of the word greed, and other poor wording. Not much else comes to mind when I hear the name Gates. My apologies if you took that term personally against yourself, which it was not intended. I'll rephrase:

Chris stated in his earlier message, that there were other (better) reasons besides profit for doing Atari 8 bit related projects. It appeared that you considered that train of thought idiocy, as though people in the 8 bit world were still profit oriented. I'll submit as an argument that virtually everyone doing commercial projects related to the Atari could be making significantly more money, probably with less effort, by focusing their talents somewhere else. So why are they doing 8 bit stuff? Yep, back to that labor of love stuff. Now some of these projects may stand on their own feet and support themselves, but that only keeps them from being a financial burden to their creators, and is far from the motivation that caused their creation in the first place.

There are many projects I have run across that would either not exist at all, or would be substantially different if their main purpose was to turn a profit. Most of my best experiences are with projects, and people, that deal in other motivations.

Your houses are probably very nice, and better than the Gates-like crap that some builders provide. And yet, they won't compare to something custom built by a meticulous owner that isn't concerned with how much time it takes, how much it costs, or what price it will bring in resale. You'll make a lot more money selling one of your homes than I will selling mine. But I'd rather live in mine. (whenever it gets done...)

The last six bytes in the cartridge space, from $BFFA-BFFF contain the info
needed to identify and run the cart.

BFFA,B - Run address of the cart.
BFFC - Must be 0
BFFD - config bits:
0 - 1=boot the disk
2 - 1=start the cartridge after booting
7 - 1=Diagnostic cart. Starts before any of the OS is initialized.
Normal values for $BFFD are $04 if it does not support disk booting, or $05
if it does support disk booting.
BFFE - Initilization address. This is called before the run address, and
is always called regardless of the state of BFFD bit 2.

re: telecommunication via carts
I'll try to keep it short<g>.
IMO: The best way to do a cart in order preference is: assembly language, Action!, any compiled language like [MMG basic compiler, C, ...], basic. This is because you can specify where your code goes with ML or Action! so you only need one image in the machine (saves memory for buffers etcetera). I have used the "compile to disk" program for Action! & it worked very well.
CC65 lets you specify where the code starts so it probably should be up there with Action!, but I haven't tried it yet. I've made carts of other peoples programs where I just store their program in the cart address space, then relocate it to the proper address at boot time. *MANY* Atari carts that originally came out as a cassette were done this way. At one time someone on CI$ almost got me interested in making an autoboot basic cart/program for him, but as happens, he never finished his end. I'm not a real fan of basic anyway so I didn't do it W/O a reason. I think I'm probably the only one who even considered the problem since most people who know enough make a cart in the first place consider the basic thing kind of retro. Anyway, "a" way to do it is with 16k of EPROM. Stick your listed basic program into the $8000-$9FFF space & a modified basic ROM into the $A000-$BFFF space. The basic's cart START address currently points to logcally enough, the cart's start address, all you should have to do is have it point (change two bytes) to a M/L routine in the 2nd ROM's address space that puts basic in the forced read mode & enters the LISTed program. This is a little pricey/goofy of a solution though since 2 EPROMs & cart can run you $13-$16. That being said,
Assuming a 8k or smaller cart: For the address space $A000 to $BFFF there are only 4 magic memory locations in a cart that use a total of 6 bytes, everything else is available to the user.

$BFFC cartridge present flag 0=> there's a cart here. Anything else => no cart. The way Atari data lines seem to work, if there's nothing there it'll read $FF.

$BFFD Boot option flag. It's been a while & I don't have my OS ref handy, but BASIC has this set to 5 which allows a disk boot (& maybe a cassette???). Most game carts have a 4 here=> don't let the drive in. If anybody REALLY needs to know I'll dig out my manuals. Also lets the OS know if it's a diagnostic cart plugged in.

$BFFE 2 bytes cart initializion address
The OS jumps to subroutine at this address REALLY early in the boot process, before it even opens the E: device. I'd guess at least 90% of the Atari carts just have it point to a RTS somewhere else in the cartridge. If you really wanted to, I guess you could use it for doing things like lowering MEMTOP to reserve space in high memory, but you can do that during the mainline code anyway.

$BFFA 2 byte address for cartridge start. This is the last thing the OS jumps to after it finishes all it's other house cleaning. Ever notice how some games flash a blue screen before they start running? This is because they go ahead & let the OS open the E: device by not taking control at the $BFFE address. The blue screen is up while the OS is looking for disk boots or whatever.

Now an example for a single stage load & go type program. If you look at the file header you will find the standard binary file ID [255, 255] followed by a start/end load address $2000, $3F60 or whatever. Write these down! You also will find the file is slightly longer then you would calculate. After you read the header bytes, there are more then $1F60 bytes left in the file. What is happing is the start/init address of a DOS file is always appended to the end of the file. The extra bytes will look something like [$E0, $02, $E1, $02, $00, $20]. In Atari this means "More bytes to load starting @ $2E0, ending @ $2E1 & those bytes are $00, $20." But in Atari, locations $2E0, $2E1 are special, DOS looks at them & if they are modified assumes they are a run address. Write this ($2000) down!
We also need a short hunk of code to relocate everything from cart to where it wants to run. Since the file only uses $1F60 bytes we can assemble anywhere above $BF60, but just to disk! REMEMBER! I'm doing this off the top of my head so there will be mistakes! <maybe many>.
Something sloppy like:

1234. carts

Source record: 102423

```
05 *=$BFB0 ;WRITE THIS NUMBER DOWN!
10 LDA #$00 ;from $A000
20 STA $CB
30 LDA #$A0
40 STA $CC
50 LDA #00 ;to $2000
60 STA $CD
70 LDA #$20
80 STA $CE
90 LDX #$20
100 LDY #$00
110 LDA ($CB),Y
120 STA ($CD),Y
130 DEY
140 BNE $BFC4
150 INC $CC
160 INC $CE
170 DEX
180 BMI $BFD4
190 JMP $2000 ;the other code's start
195 CARTINIT
200 RTS ;our own RTS for CART INIT

ASM,,#D:PATCH.OBJ
```

Now it get's a little more complicated. I have burners for both my Atari & clone. The Atari burner needs the header info, the clone just needs the raw data. Let's create the binary image first. I always use a monitor type program or a sector editor, it doesn't really matter. If you don't have one you can even use basic. Something like:

```
10 DIM A$(8192)
20 OPEN #3,4,0,"D:TEST.OBJ"
30 FOR N=0 TO 5:GET#3,B:N.N
40 TRAP 100
50 FOR N=1 TO 10000
60 GET #3,A:A$(N,N)=CHR$(A)
70 N.N
100 CLOSE #3
110 OPEN #3,4,0,"D:PATCH.OBJ"
120 FOR N=0 TO 5:GET#3,A:N.N
130 TRAP 200
135 REM I THINK THIS IS ABOUT THE
137 REM RIGHT OFFSET
```

```
140 FOR N=8113 TO 10000
150 GET #3,A:A$(N,N)=CHR$(A)
160 N.N
200 CLOSE #3
210 REM CART STUFF TO STRING
215 REM ASSUMES STUFF LIKE STARTLO
217 REM IS DEFINED ELSEWHERE
220 POKE ADR(A$)+8191,CARTINITLO
230 POKE ADR(A$)+8192,CARTINITHI
240 POKE ADR(A$)+8190,5
250 POKE ADR(A$)+8189,0
260 POKE ADR(A$)+8187,STARTLO
270 POKE ADR(A$)+8188,STARTHI
280 OPEN #3,8,0,"D:TEST.BIN"
290 FOR N=1 TO 8192
300 PUT #3,A$(N,N):N.N
310 CLOSE #3
```

That should be it. The file should be able to be burned on everything *but* an Atari. To do it with an Atari you would just create a MEMSAVE, load the program into a fairly safe memory area with BASIC poke's, go to DOS & save that memory region.
I've been kicking around a design for an EPROM burner for the 8 bit. I don't seem to get that many people are interested in that sort of thing, but once again, if anybody want's me to finish & post the plans, I'd be willing. The most expensive things are the wall transformer & ZIF socket, but they should run less then $12. I imagine the whole project would be less then $20. A little more if the ability to read CARTs is added.

JG> software supports more than 64K?

Currently all of the lastest PD software from the last year or so
--ONLY-- support the expanded machines, and are unusable on a "stock" ATARI
8-BIT. GED, the Harris Graphics Editor, does not run on my 64K/48K machine.
PABQWK, the Pab Subgenius ".QWK" mailer program does not run on my 64K/48K
machine. MAE, the Harris Macro Assembler Editor, does not run on my
64K/48K machine. I wish that software that is unable to run on a 64K/48K
ATARI 8-bit would carry the designation "XE" in front of it (e.g. "XEGED")
so that users would know the software executible image was unusable on a
stock machine. It would save a lot of trouble in downloading. Strangely
enough, a program called "TEXTPRO-XE" executes on "stock" ATARI 8-bits
without much fuss. Also, a program from Europe called "MEGA-BLAST!" will
run on a stock machine without crashing.

I can probably run your debugging trace. But I need a place to start it from. I have no idea where to set a breakpoint from which to begin the trace. The basic ROM I have matches the addresses you listed in your message. So please give me a starting address, that I can set a breakpoint at. The idea being I'll type PRINT 1 and then it will BRK into the monitor where I can begin tracing. I can redirect the monitor's output to a disk file and run a trace from there.

One other thing. My monitor will not trace through the OS -- it automatically executes any OS subroutines in one step, on the assumption that they don't need to be debugged. This is probably beneficial to you, since the OS screen print routine is not going to be where your problem is. Let me know if this is not the case.

Has it ever occurred to you that the problem might be in the OS's floating
point routines? I heard that floating point math is handled in the OS.

Has it also occurred to you that the monitor might treat the BASIC
interpreter as OS?

I'm curious- If you claim that hardware on Atari 8-bits were so much better than that of Commodore's 8-bit machines, yet they were outsold 3:1? It doesn't make any sense... Computer users usually goes to the most technological platform for their money, and Atari should have won, but lost instead.

Also, can anyone clarify the hardware differences between C 8bits and Atari 8bits? For example, C=64 can display 8 sprites, whereas Atari can...? C=64 can display in multi-color mode, but horizontal resolution is halved, same thing can be said of Atari...? Etc. I'd appreciate it!

1246. Atari 8-bit items for sale

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-20 21:05:02 UTC
From: fumatorok@aol.com
Message-ID: <2midpu$t5o@search01.news.aol.com>
Source record: 102424

Hello!

I have some Atari items for sale that are in LIKE NEW condition. I'm moving, and I have gotten another system (won't tell you which one, but it's NOT an Amiga, I STILL hate Commodore. SOME of us knew better!)

Here's what I have to sell:
1 Atari 800XL, revision "B" roms, 64K, all cables, may need new cable to connect to the television set, I have the switchbox for it.
1 Atari 1050 Drive, all cables and original box. Works like a charm. Has DOS 2.5, although the box says DOS 3.
1 Atari XM 301 Modem, in box. Includes XE term.
1 Atari 410 Program recorder (brings back memories of the old days, doesn't it?), no box.
Several disks of programs, spreadsheet, game cartridges, and utilities.
Assembler/Editor Cartridge, with manual.
"6502 Assembly Language Subroutines" by Lawrence Levanthal.
"Mapping the Atari (revised for XL/XE)" by Bill Wilkinson.
A book on BASIC language for the XL
Several Compute!, Antic, and 1 Analog Magazine (years 84-85)
2 joystick controllers, 2600 type.

All of the above items have manuals with them. If I've forgotten any hardware, software, etc, of course would throw those in for the buyer. This would make an avid Atari user an excellent system, like I said, all items look like new and work like a charm. I don't want to piece up the system, so if you want just 1 item above, tell me, maybe we can work something out (if you twist my arm hard enough.....). But, obviously, package has priority. I have a price in mind (suffice it to say average prices I've seen around here for above average condition equipment), but if you want something, don't hesitate to make me an offer (as long as its not rediculous I'll probably take it). Buyer pays shipping charges. E-mail to: Fumator OK@aol.com if interested.

Later all,
CB

t >MTOS? (Multi- Tasking Operating System)??? Has anyone been able to DO much
t >with it though? It does actually work by the way... MINIMUM of 256k needed

It been a while since I last looked at Tom Hunts (I beleive) MTOS. If I
recall correctly, MTOS was more of a progarming tool to be used inside
a program than as a stand alone OS... I will admit that it's been some time
since last I looked at the program, so I may be wrong. Still, if you've got
it handy, send a copy to the archives.

True, both version 1.2 and 2.0 of Pab Sungenis's PabQwk required expanded
memory, but there is a new Qwk reader just out called Qwk8. Qwk8 was
written to work on a stock 800xl, but will not work under SpartaDos.

If there is interest, I'll send a copy of Qwk8 to the archives.

g >Well, that's my problem. I AM using Util and I HAVE a DD drive. But I'll
g >try MULE; slow or not, anything's better than nothing. Thanks.

One of the problems folk run into from time to time when using Util.com is that it seems to work best on older 360k drives. I've found, after a lot of playing around, the newer 1.2meg drives that can not format in high speed mode will also work well with Util. Drives that are able to use the highspeed mode (under PcTools) tend to not work as well with Util. I've been led to understand that it has something to do with the size of the read/write head. Now, I don't recall from your first post whether or not you had a 360k drive.

If you've not got a copy of MyDos, I'll see that you get one. What you may want to do is format a MyDos DD disk on your Atari first rather than using Util's format command, until I started using SIO2PC, its what always worked best for me.

Source record: 102438

In a message dated 3-19-94, Todd Elliott asked:

"What's the difference between an 800xl, 1200something,
200whatever, it looks like an alphabet soup."

The readily available Atari 8-bit systems include the old 400 & 800, the 1200XL, the 600XL & 800XL, the 65XE, 130XE, and the XEGS (gs = games system). Essentially, all the machines are primarily compatible, but there are some differences. For your purposes, I would skip the old 400 and 800. Of the remaining machines, all have 64K of RAM, except for the 600XL, which has only 16K, and the 130XE, which has 128K. All of the XE & XL have the same graphics and sound capabilities.

The 1200XL was the first XL. I've got one and think it is great. The pluses are that the chips are socketed (great for hacks and upgrading), and the keyboard layout is the best (IMO) of any of the 8-bits, and the keyboard feel (again, in my opinion) is the second-best (the old 800 being the best there). On the downside, is lacked the PBI or ECI the 600&800XL had, or the ECI of the 130XE, which is necessary for being able to use some expansion devices, such as the ICD MIO or CSS Blackbox. Unlike the remaining XL and XE models, BASIC was not built-in. It also has a much larger footprint than the any of the other 8-bits, with the possible exception of the XEGS. However, it is by no means as large as a "flat" Commodore 128 (it may be deeper, but certainly is not as wide...no numeric keypad...none of the Atari 8-bits included one).

The 65XE and 800XL were extremely similar machines internally. However, the 800XL is the more favored of the two, and is the closest to what I think you are looking for.

The 130XE added an additional 64K of banked RAM, paged in 16K at a time. Compatible (and larger) upgrades are available for the other A8's. (My 1200XL has 256K). While the ECI port can work with PBI devices, it requires an adapter (an extra expense, if nothing else), and has the cart port in an inconvenient location compared to the 800XL. Also, the keyboard appears to not be as "durable".

The remaining machine, the XEGS, is essentially a two-piece 65XE, with the cart port on top, and a separate keyboard (like the 128D). No built in drive, but it can use any Atari 8-bit drive, just as the other machines can.

Also, the XEGS has no PBI or ECI port, and like most (if not all) of the XE's, most of the chips are soldered, not socketed, which makes internal hacks and upgrades a pain.

My recommendations would be an 800XL, or failing that, a 1200XL. (If the 1200XL had a PBI port, I would recommend it in a heartbeat as my #1 choice...

I don't find the lack of built-in BASIC that much of a drawback, and
Atari BASIC carts can be had for $15 or less).

You can *tell* when a product is being created for profit and when the creator really has his heart in it. The programs I use and have faith in are almost always from individuals or low-key companies who aren't falling for the ol' "world domination" bit. Then there are the programs that cry "I wrote this to try to weasel into the supposed multi-billion dollar software market" or "somebody beat me with a stick for eighteen straight months to get this out the door, so here it is dammit!"...

Who says Atari is better? I own an Atari 800xl. 512K, w/stereo, w/US+OS. It's a decent computer. I also own a C-128 (actully 2 of them) w/stereo and soon to have 256K. Both computers have their points. Atari is easier to upgrade from a hardware standpoint, has more colors. CBM has better resolution, and more precise color blocks. Not to mention special modes to get multi-color in hires monochrome mode. At least you can change text color on a CBM. Can't on atari. Got to bit-map text in a graphics mode. Color cells are too large reducing the apperent resolution. CBM also has better sound. I haven't heard anything impressive on the Atari. Nice, but not impressive. Atari is a little faster (CPU wise). But has lousy math routines. Even with the US+OS (which claimed to improve the math) is still flat out wrong on many caculations. Yeah, great computer, can't do math!

About the only really nice thing about the Atari is the fast I/O of the drives and stuff. At the time that their computer/drives came out, it was FAST. ALOT faster then the C64 standard serial. Of course, with JiffyDos and the C-128 line, Atari is slower. Well, unless you have a 1050 w/US Doublers.

As far as software. From this Country, no, definatly not anything. Atleast not anything worth having. Overseas thou....Yes. There is some nice stuff from Europe. Megablast for one.

p> Of course, I'm the sort of fellow who still haunts record shops looking

Todd, don't take the lack of other responses as being lack of interest! I'm sure many of us are glad to have another curious 8bit hacker... err, user inquiring about the old Atari 8-bit's. It's just that... well, I'd say Lonnie covered the topic pretty thoroughly. I also have a few old 8-bit models, and my preference would be one of the big three: 800, 1200xl, or 800xl. For a good hardware hacking / HD / expansion (PBI) port machine, it's the 800xl, hands down. (Unless, of course, the 600xl 256k internal UG plans get finalized and published in Atari Classics (plug plug)).

The 1200xl is an old favorite of mine, but the lack of PBI port is a big factor. The 800... well, what can I say. It IS my favorite, best keyboard, INTERNAL SPEAKER (if you know the codes, you can have that poor thing screaming digitized sound in no time... no volume control since it's not coming out of the monitor... scares the heck out of... well, forget it).

If you have any other questions, feel free to ask away!

Kia Ora from down under. Yes, it _is_ actually me! I'm still hanging around but I've been a very naughty lurker for a long time. I don't run Pandora's Box on my trusty old 8-bit anymore _but_ I do have my own node (private) for collecting of email and 1 or 2 of my favourite newsgroups. Your message set me off thinking about 1 or 2 kiwis I know of that don't have access to Usenet but are still interested in the Atari 8-bits, I'm going to give them a call and see if they'd like to access it through me so maybe they'll be popping up in here very soon. I know of at least two other kiwis that read this newsgroup (hi Chris & Bob), no doubt there are more out there though! It's nice to hear from you again and keep up the good work with AC.

Hi Hiram, yes you are quite right! The lurker surfaces.....

PS Hiram and I used to network between Murfreesboro, TN & Auckland, NZ
with OasisNet on our 8-bits. It cost us a fortune in toll bills but it
was an interesting exercise and I met a lot of great computer friends
over the years. It would probably still have been going if Hiram hadn't
gotten himself a girlfriend and decided she was more fun than his
computer *8-). Out of the blue one day when I called I received this
cryptic automatic message about his phone being disconnected ... very
naughty of you Hiram!

Todd - I'm not sure I can agree that users go to the most technologically advanced platform. The original IBM PC (8088 at 4.77, CGA graphics) was pathetic, but thousands of people rushed to spend $3,000+ on one. IBM had the marketing and distribution channels that are necessary for success.

The 2600 crash of 83/84 did a lot of damage to Atari dealers, and those negative attitudes carried over to the computer line as well. Many stores simply stopped handling ANY Atari merchandise. I remember that Commies were still selling at K-Mart and Target stores long after they had dropped the Atari line. So I think marketing had more to do with Commodore's success than any hardware differences between the machines. Just my $.02.

I've been asked to clarify my previous posts about the 8-bit emulator which I have begun to produce. So, the timescale for a project of this magnitude is going to be long. Do not for one minute think that this is going to be ready soon. I'm looking at about 1 year, parttime coding for version 1. There is no way of producing anything of this kind quickly. The project is in it's infancy, partial planning, partial coding. and there is a very long way to go. If the project does not work out, I shall announce my defeat here on the net....(sob sob) But, I am optimistic. In the meantime, you'll just have to keep using your hardware, or one of the other emulators.

Hope this clarifies things....Zargwog...(not a German or a Swede!...not that there is anything wrong with being a german or a swede you understand...nonono...I'm sure it is quite pleasant being either, but I'm not...either that is....I'm English...you know, the stuffy ones that float just off Europe...Yes, that's us...can't help it though... it's just the way we are I'm afraid....apart from our Football (that's soccer) fans... they're all androids from hell....especially Millwall supporters...not that there is anything wrong with supporting Millwall.....perhaps I'd better shut up...) *grin*

Obviously, it is in an endless loop. Loops are mostly terminated by a cpu-flag being set or unset. Maybe some flags do not work properly. Try counting the characters between the start of the number and the first repeating. If it's (a multiple of) 256 or something like that, you can be quite sure a loop isn't terminated because of a flag which is not being set/unset.

Being the author of QWK8 I should mention that I have uploaded a new version plus the C source code to Genie and to a local board, Rubber City (216-376-0885). If anybody wants to take a crack at writing a note/point routine that works in Spartados they are welcome to try. They can add it to available source or whatever. By the way, I started to rewrite the code from ACEC & CC8 to CC65 and found CC65 to be inadequate in so many ways that I gave up. However CC65 has this beautiful quality, unix-like... whilst interposing an extra step in the compile sequence, however also being relocatable by way of compensation. Oh well.

1264. Re: Two questions.

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-21 13:50:41 UTC
From: rstout@legend.akron.oh.us
Message-ID: <rstout.0oy5@legend.akron.oh.us>
Source record: 102363

As the author I might add that QWK8 was developed using spartados 2.3
... which dos has a standard atari note and point, and is 4K smaller
than other atari doses.... which gives us 4K more buffer space.

Bob Stout
* QWK-8 *

1265. QWK8V3.ARC

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-21 14:15:38 UTC
From: rstout@legend.akron.oh.us
Message-ID: <rstout.0oyb@legend.akron.oh.us>
Source record: 102364

QWK8V3.ARC has been uploaded to Genie. Also the source code has
been uploaded in QWK8SRC.ARC.
I would recommend running QWK8 with spartados 2.3 since it would
give a 4K increase in buffer space. If you want to use QWK8 with a
later version of sparta then somebody needs to write a proper
note/point routine in ACEC & CC8 and recompile the source. I have
experimented writing it using floating point to handle large integers
and got some of it to work.

Bob Stout
* QWK-8 *
P.S. QWK8 is an offline reader for the 64K atari 8-bit.

1270. My original post (was: Re: Hello Chile)

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-21 19:15:24 UTC
From: vparada@inf.utfsm.cl
Message-ID: <Cn145x.K98@inf.utfsm.cl>
Source record: 102443

Hola mundo (& Raphael).

The following was what I tried to post...

- - - - - - - - - 8<---- cut here ---------------------------------
Finally, I got the 850 interface, with 830 acoustic modem, but...
no power suply, no SIO cord, no RS-232 cord, no user guide,
just a cord with 9 and 25-pin connectors (850 to 830? 850 to PC?
850 to ST?).

I just want to transfer some programs from the archive to the
8 bit, but I don't know the pin-outs of the cable to connect the
850 to a 25-pin PC's COM2: as a null modem.

I have tried the following: XE-term, HomeTerm (HomePak),
BobTerm, Mini Office II Communications, Gardner's Modem, and some
XIOs from Atari BASIC. In the PC, I tried Xtalk, Telix and
COPY AUTOEXEC.BAT COM2:
The parameters used were: FDX, no parity check, 1200 baud, 8 bits
and 1 stop bit.

Sometimes I got garbage on the Atari, sometimes nothing. The PC
never received data (even wrong).

The pin-outs I tried are:

25 pin = 9 pin This is the cable I got!
2 3
3 4
4 7
5 8
6 6
7 5
8 2
11 9
20 1

25 pin = 9 pin A friend used this for VT-100's or PC's
2 3
3 2
4-5 -
6-20 -
7 5

25 pin = 9 pin A simple modification because Send and Receive
2 3 are not in pins 2 and 3 of port 1 on the 850.
3 4

7 5

25 pin = 9 pin I don't know which are Send and Receive on the
2 4 PC's 25-pin RS-232.
3 3
7 5

Did I miss something? Some bridge in one connector? Some connection
between the connectors? The wrong software? Ugh!

In a magazine, it appears the following:

25 pin = 25 pin
2 3
3 2
4-5-8 -
- 4-5-8
6-20 -
- 6-20
7 7

I didn't try this, because the 850 has 9 pins :-(

Can someone send me a working cable pin-out, the name of the software
to use, and some other parameters (baud rate, parity, #bits, ...) ???

Please answers trough e-mail (here, news arrive 1 week later, and I'm
anxious... ;-)

Thanks a lot!!!

Bye... ++V

Are you talking about an adaptor for hard drives? If not, then what is it?
(I probably need one, if it is for hard drives.)

1272. null cable pinouts

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-21 20:04:33 UTC
From: randy@rmtc.Central.Sun.COM
Message-ID: <9403211803.AA04640@pollux.test.mane>
Source record: 102445

In making a null cable, you merely reverse the send and receive pins, and connect ground straight through. This means the pinouts depend on what size port you are using, 25 pin or 9 pin. Assuming you want one that goes from an 850 (9 pin) to a 25 pin COM port on a PC, you would connect:

9 pin #2 to 25 pin #3
9 pin #3 to 25 pin #2
9 pin #5 to 25 pin #7 (ground)

as for software, just use bobterm on the atari side and qmodem or something similar on the PC side. I use amazing baud rates, the 850 will only go up to 9600 (which is fast enough!) but I use an MIO so kick it up to 19,200. I never get any error blocks, and my cable is about 40 feet long (I used a shielded, 25 strand cable that was a throwout from an old computer store. I also use 3 strands per pin)

Randy

1273. 8-Bit Markeplace (WAS: Old Games)

Source record: 102446

In following this thread I see the same old misperceptions that are strangling Atari Classics.

FIRST: Ben Poehland did not start AC, THE 8-BIT COMMUNITY DID. In response, if you'll recall, to an inquiry posed to the rest of the community by a few members of the community now infamously known as the Campaign Committee (led by one Jeff McWilliams, now late of this net). AC has ALWAYS been the physical manifestation of a grass-roots movement within the user community, NOT a commercial venture. It bums me out that people seem to have lost sight of that. Instead, we are being treated like any other commercial entity. I tried to make that point a year ago in an editorial called "Us Guys Iz Yooze Guys". I now know that editorial was a waste of time.
2nd : AC was founded to be non-profit. Operated as a business, yes. But only because we had a product to produce & bills to pay. If the mag had been set up to make me rich (man, that's a laugh!), with a full-time salaried Staff, it would have probably cost at least 2 or 3 times what it does.
3rd : Mostly because, I think, people have lost sight of the manner in which AC originated, the magazine is faring poorly. During the past 4 months we have gone from a condition of being 5% oversubscribed to one of being 20% undersubscribed. We are foundering. This is not a case of the community failing to support a vendor. This is the community failing to support ITSELF!
4th : Anybody out there who thinks you can produce some amateurish/crummy/half-baked diskmag or on-line mag that contains the kind of information AC published in its December issue, has rocks in their head. And just for record, the diskmags are falling like flies. True, AC is a labor of love. We might pay a little money to our editors & authors, but nobody gets rich on $25 for an article. The problem with most of these ram-shackle efforts is that their frequency of publication varies all over the place, & as does their quality. AC tried to rectify that by offering a product that was rigorously produced & reasonably on-time (this year is the first time we've been late). You get what you pay for. I think AC offered value for the money. Apparently the community does not agree. So, if people are happy with on-line mags & diskmags, then they should have said so in the first place & not agreed to let 25 people ruin their lives to give them a magazine. 615 people pledged to support AC. Fewer than half honored the pledge. The rest all got a free magazine, paid for by the truthful half of the community. What does that say for us?

I agree that any vendor selling old products has to compete against the community itself. That's why we need NEW things, so new vendors can establish market niches like Nick Kennedy did. Even the stuff that FTE is doing is not new, it's just a re-packaging of old ideas as I see it. AC published "Dream Street" as an enticement to entrpreneurs. No one bit. Instead, people come

into the market with their own ideas of what they THINK people want. Not that that's necessarily bad, but in a market this tiny it's taking a helluva chance.

Just my $.02. :)

- Ben Poehland

I agree that marketing had alot to do with the C64's success, as well
as the quality of the machine. (excluding the BASIC editor or course)
The only thing I don't understand is why the marketing machine behind
the C64 could'nt do the same for Atari? (You know 'Business is War' Jack)
Another thing that I always wondered about is why was the Atari singled
out as the computer of software pirates, when every kid on the block
who had a modem or a friend with one had a library full of hot disks?
I never agreed with the Atari-Commadore user wars, htey did nothing
to benefit either machine. Any machine rises or falls on the programs
available for it. A good programmer can take any decent machine and
make it look great. I'm glad (for the most part) that now every
other message does'nt contain the words Atrashi or Commode 64. Let
s keep it that way.

>

I don't have the addresses at the moment (I'm at home-- and they're on my
Alpha at work) but the one I gave before is where it dropped back into
BASIC after I hit RETURN, so that should probably work.

>One other thing. My monitor will not trace through the OS -- it
>automatically executes any OS subroutines in one step, on the assumption
>that they don't need to be debugged. This is probably beneficial to you,
>since the OS screen print routine is not going to be where your problem is.
>Let me know if this is not the case.
>

Umm.. there we could have a problem. You see, I don't really know if
the bug is going to show itself in the BASIC ROM code, or in the OS ROMS...
I'm almost willing to bet its something funky the floating point math of
the OS does.... but when I looked through thousands of lines by hand I couldn't
find anything that looked wrong, which means either 1) it was okay, 2) I'm
not very observant, or 3) I've got a misunderstanding of the 6502 still,
after all these years (which I doubt, since I've got the spec sheets and
I've worked with that thing for years, but there are some nuances of the
flags I've never taken advantage of before)
This is why I want a trace of what really happens, so I can compare until
I find the fault. So, if you've still got my original posting with
the address that it dropped back to after the call to CIO finished,
try starting from there and going until CIO gets called again.

Your help will be GREATLY appreciated. (and not just by me, since I'll
probably be able to release this thing finally!)

Yes, I definately thought of this-- I didn't count to be sure, but I did
trace through forever, and although there's a general sequence of events that
keeps repeating, I couldn't figure out what part was repeating that shouldn't--
in other words, there was no single, tight loop that was repeated-- because
of the calls to the FP ROMs there are lots of nested loops and it was very
difficult to tell which part was the culprit, since all instructions seemed
to be doing what they were supposed to as far as flags, unless I've got
bad info on the 6502 CPU flags... does anyone have a list that they are SURE
is correct of which flags are affected by each instruction?

This is why I want a trace, to see exactly at what point it's going astray.

No, that's fine. One from an Atari Emulator will do equally well, as long as it's
one that works right. It's funny-- I've got all the funky graphics chips emulated,
including player-missile graphics with collision detections and display list interrupts
work and everything.... but I can't quite get the 6502 perfect, it seems! It works
for everything except some math stuff.... but when I checked to see if it was the decimal
mode instructions I found the CPU wasn't even in decimal mode for some of the things
that screwed up! Oh welll....

>they're all androids from hell....especially Millwall supporters...not that there is
>anything wrong with supporting Millwall.....perhaps I'd better shut up...) *grin*

Well, I'm planning on releasing mine to the net as soon as I get the trace I need
to fix some bugs, and after a little device support is added so people can boot
it from a virtual disk. (right now I just have a mini-Atari-DOS built into the monitor
that can load Atari files directly-- but that won't work for boot disks)
I also want to allow printer and RS-232 output to be directed to actual devices
or files. But compared to the bug I have to fix, all that should be easy.

So-- once I release it, you can refer to it if you want, to help you work on your
emulator, or, if you are planning on just making a PC or some other specific version,
you could use the core of my emulator, and change the X-Windows interface to your own
PC (or whatever) interface... (which is VERY easy the way I have it separated)

I'm just making sure you're aware of this now because I'd rather have our efforts
go towards a common goal of making the most accessible, efficient emulator possible,
rather than being competition.

You wish it, I dish it. Cross-posted to the Commodore newsgroup.

Commodore Screen Modes:
Commodore hardware limited to 16 colors:
Black, White, Red, Cyan, Purple, Green, Blue, Yellow,
Orange, Brown, Pink, Grey1, Grey2, Light Green, Light Blue,
and Grey3.

* 40x24 Text, 1 Background, 16 Foreground Colors, 8x8x2 Characters
* 40x24 Multicolor Text, 1 Background, 16 Foreground,
2 Secondary Colors, 4x8x4 Characters
* 40x24 Multibackground (*)
* 320x200x16 Bitmap, a screen full of 8x8x2 cells. Each cell can have
different background and foreground colors.
* 160x200x16 Multicolor Bitmap, a screen full of 8x8x4 cells. Each cell
can have 3 different foreground colors, all cells must share same
background.

Atari Screen Modes:
128 colors can be used in most modes (8 brightness, 16 hue)
256 colors, if you count extra brightness available in "Gr9"
(16 shades mode)

Fonts conatin information for first 128 characters only. 128-255th
characters are reversed by hardware.

(NOTE: A screen can easily contain multiple modes.)

* 40x24 Text, 1 Background, 1 Foreground Colors,
Foreground and background must be same hue.
* 20x24 Double-Width Text, 1 Background, 4 Foreground Colors. (*)
* 20x12 Double-Width, Double-Height Text, 1 BG, 4 FG Colors. (*)
* 40x24 Multicolor Text, 1 Background, 4 Foreground Colors. 4x8 chars.
Chars 128-255 change one of the foreground colors to #4.
* 40x12 Double-Height Multicolor Text, same as above.
* 40x24x4 lo-res graphics mode.
* 80x48, two or four colors
* 160x96, two or four colors

* 160x192, two or four colors.
* 320x192, two colors. Foreground and background must be same hue.
* 80x192 GTIA modes:
- 16 shades of one hue (Called Gr9)
- 16 hues of one shade
- 9(?!) custom colors (choice of only 128)

Commodore sprites:
8 sprites: 24x21, can be doubled in height or width.
Multicolor sprites must share last two foreground colors, and are
halved in resolution.
Minimum resolution of a monochrome sprite comparable to that of a
320x200 screen.

Atari sprites:
Called "player/missile grpahics". Four players, four missiles.
Players are columns of monochrome bytes that extend down the entire
screen, missiles are the same but are columns of two-bit pairs.
Can be doubled or quadropled in width, and doubled in height.
Minimum resolution comparable to that of a 160x192 screen.
Missiles usually match the color of their corresponding player.

There are numerous other little-known things about each platform that
are too confusing to go into detail about. (Yes, more confusing
than this.)

(*) Foreground (or background on C64 Multibackkground Text) is
determined by the values of the two most significant bits.
For this reason, only 64 characters can be displayed in
these modes.

3) Timewise (Time management), $10.

4) "Kingdom" (Instructions and
game, cassette), $3.

5) "Biorhythms", (Instructions and
game, cassette), $3.

6) "Super-Text" word processor
(disk), $5.

7) "Midway Campaign", $15.

8) "Strip Poker", $10.

9) "SynsStock" (Stock charting) $15.

10) "Sargon III" (Chess program) $15.

11) "SCRAM"(Nuclear Power Plant Simulator), $15.

12) "GO" (Ancient Japanese game, harder than Chess) $10.

13) "The Newsroom" $15.

14) "Movie Maker" (Animation Construction Set) $15.

15) "Atari Planetarium", $25.

16) "Proofreader" (Spelling Checker for Atariwriter), $20.

17) "Your Personal Net Worth", $20.

18) "Managing Your Stocks", $15.

19) "Softporn Adventure", $5.

20) "Pinball Construction Set", $15.

21) "Personal Inventory Manager", $10.

22) The following from XLEnt Software, $20 each, or all 5 for $75.:
(A full desktop publishing sytem for the 8-bit Atari)

a) Megafont II
b)The First XLEnt Word Processor
c)Rubber Stamp
d)Typesetter
e)Page D: I have over 50 disks of public domain and other
software,
graphics, utilities, games, for the 8-bit Atari's. All for $35.
(That's less than 70 centa a disk!)

BOOKS ($3.95 each plus shipping)

Atari Programming with 35 Programs

An Atari in the Classroom

Your Atari Computer

PLEASE ADD $5. FOR SHIPPING TO ALL ORDERS UNDER $35. I WILL PAY
SHIPPING ON ALL ORDERS OVER $35.

The superior hardware almost never wins. The PC sucked people away from other machines back when it was a total dog. The Amiga has always floundered. Ditto for the Atari ST. The NES outsold the Atari 7800. And so on.

As for why the C-64 did better than the Atari machines, I always attributed it to the "64K". I remember lots of people being most impressed by it having that much memory while the Atari 800 only had 48K (remember, this was 1982).

But it's a moot point. Both machines had avantages and disadvantages. If I had to come up with a reason I thought the Atari machines were better, it would be because of more colors (128 vs. 16) and, IMO, a much cleaner hardware design (you've gotta love how display lists let you optimize memory usage).

>I'm curious- If you claim that hardware on Atari 8-bits were so much better
>than that of Commodore's 8-bit machines, yet they were outsold 3:1? It doesn't
>make any sense... Computer users usually goes to the most technological
>platform for their money, and Atari should have won, but lost instead.

One simple reason the Atari had bad markiting. The atari is simple
the BEST 8-bit around. No other computer had as many built in "tricks".
it was one intelgent intergrated machine. It would take at least a 286
and a VGA moniter, a sound card, a joystick card. To even come close to
the atari's graphics and sound.

Here is a list of some of the Ataris featers compared to a PC

Atari PC
80 colume mode X
player missle graphics X
graphics and text mode X
on the display at the same
time.
20 colume text mode X
4 sound chanels X

and lots lots more that I can't think of....

All of the updates of this list can be found on the Cleveland Free-Net
Atari SIG in the Atari Library. It will be posted on Usenet very rarely
so visit CFN often!

Cleveland Free-Net Atari SIG's
Who's Who in the Atari Community E-Mail Directory

The following people are members of the Atari Community that do things that
helps Atari users and the Atari Community in some way on a continuous basis.
They are Atari BBS sysops, dealers, developers, publishers, user group
presidents, writers, FAQ maintainers, etc. They are even Atari employees.

Everyone on this list gave their permission to be on this list.

If you contribute some way to help others in the Atari Community on a continuous
basis and would like to be made more available through e-mail incase someone
wishes to contact you, please send e-mail to the Cleveland Free-Net Atari SIG
at: xx004@cleveland.Freenet.edu

NOTE: Only people that send us information themselves will be included on
this list. In other words, you cannot just give us information about another
user that should be on the list. THAT user has to give us information
him or herself.

Report any changes to: xx004@cleveland.Freenet.edu

This list may not be reprinted for profit.

Atari user groups may reprint this list without permission as long as
the following information is included on the top of this text file:

Cleveland Free-Net Atari SIG's
"Who's Who in the Atari Community E-Mail Directory"
telnet freenet-in-a.cwru.edu

: I'd just like to say thank you. The Atari community needs more real
: programmers like yourself.

I can not agree more strongly, Qwk8 is a really fine program that supports
a good number of offline reader features. It works great on a stock 800xl
with only a 1050, given the normal speed limits of such a system, it's
really very quick, run in a ramdisk, it's as fast as anything out there.

A Qwk review...

Qwk8 sports a 40 col. editor, yet can save your replies in either 40 or 80 col
mode. Qwk8 does allow quoting of articles however, it quotes the entire
article. The editor has the same limits as the early versions of PabQwk and
QwkSilver, that being, once you've entered a line (hit the return key or had
the program roll over to the next line) you can't go back and edit it. Still,
its not a limit, just a thing to remember. Jumping around the message base
is very easy and quick, one of the fastest I've seen for any of the 8bit
Qwk readers.
Qwk8 (the version I d/l'd from GEnie) does not support taglines nor does it
add a brag line to the end of your message. I've used it on several boards
that support Arc Qwk packets, and have had no problems at all. Qwk8 even
works well with the packets produced by UQWK, skipping over the format
errors it produces.

: People, if you need something and the Atari community needs it as well,
: and you can program it or already have, don't hesitate to share it with
: others because "shareware doesn't work anymore, I won't make any money"
: or "it's not compatible with GIF89a/ZIP 2.04"...

Again, I can not agree more strongly. This community is still filled with
so many talented peope, many only need to know from this community what
is needed. And it is up to us to support these folk, be it shareware fees or
only a card or E-mail, its up to us to let these folk know what we think and
that we support their efforts in supporting us. As I've learned, many in
our small community do what they do simply out of the desir to do it, but
a little support and encouragement from the rest of us goes a long way.

Mike

Well, it's been about 2 years since I actually used the 800XL for any
length of time. I pulled it out about a month ago and played with it a
little. I keep wanting to set it all up somewhere. Maybe when my son gets a
little older I will. Sure isn't anything quite like it though.
As far as new software, I probably have missed a lot. When I started to not
use the computer as much, there was very little software you could buy that
was new. Antic had finally folded, and very few magazines published anything.
It was kinda sad. It is nice to see these kinds of groups and similar groups
on Compuserve and the like, however.

>Heck, someone wrote a *nix like operating system for the Apple IIgs.
>That's quite an achievment, IMO.

It's amazing how small *NIX systems can be. AT&T's first 3B2 computer
(a 300/310) came with a 72Meg harddrive and 2Meg of RAM. It was a full
multiuser/multitasking computer with networking, etc. I used the first
AT&T personal unix computer (a PC7300) as a terminal and personal computer
for years. It used a 68000 processor, had a 20Meg hard drive and 1Meg of
RAM (I think). Not truly a multiuser computer but it was multitasking
and had all the functionally that any Atari 8bit user would want in a
personal *NIX implementation.

Ah, the good old days. I must be getting old.

What a concept! Instead of buying a PC, I can get the new Pentium emulator for my 800XL. Then I can run the Mac emulator in the PC emulator and run the apple][e emulator in the Mac emulator and play Apple Panic. Somebody get to work on this right away! Gotta stop now, the excitement has made me dizzy.

One problem with converting to carts is you (normally) must have the source code. Unless you use the trick someone mentioned (in the cart executable, you relocate code from ROM to RAM area, and turn the cart off), you must have the code ORG'ing from somewhere above $8000. The block of code from there to $9FFF (or $BFFF for a 16K cart) must be read only (don't expect it to be RAM anymore :^). Chuck Steinman did the final conversion of "Maze of Agdagon" to a cartridge, and kept finding areas where he and I assumed we where all in RAM. It works great now...

There's a nifty version of Unix for the Commodore 128 so I imagine something
similar could be done for the Atari.

> Since most (all?) Unices are written in C, what are the possibilities

I'm digging around for Matrix which my friend and I started writing back in
1986. It was a unixish OS for the C-64 with a Quick Brown Box cartridge. It
could easily be converted to the Atari and would be happy in a 130XE or
expanded xl.

1294. XEP80 Repairs?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-23 00:34:08 UTC
From: lordthan@news.delphi.com
Message-ID: <2mo2q0$kgk@news.delphi.com>
Source record: 102375

One of my "friends" had borrowed my XEP80 awhile back. When he returned it to me, he apologized profusely and explained that he "probably killed it" by (get this) plugging the power cord into the video port. Fine.

Except that *nobody* can/will repair this thing; everyone tells me "oh, just buy another one." Frankly, it's not worth it. I bought the XEP80 basically as a toy, something to play with, and I've gotten a grand total of about a week's worth of use out of it. (I bought the thing *years* ago, and it's been sitting in my closet ever since it came back DOA.)

So can anyone point me in the direction of someone/somewhere that will fix this thing for me (a) without trying to sell me a new one, and (b) for significantly less than the ~$50-$80 that I've seen for new/reconditioned ones? I find it difficult to believe that for how cheap Atari stuff is in general, there are so many "ah, just throw it away and buy a new one" answers out there. Maybe for *some* people with money pouring out of their asshole, but not me.

Is there any chance that the QWK8 .QWK mail packet reader could be
rewritten to use a standard ATARI DOS (such as ATARI DOS 2.5 or MYDOS 4.53)
rather than the --COMMERCIAL-- SPARTADOS, so that it can be used more widely
by more of the original equipment (such as an ATARI 800 and an 810 drive) ?

Has anyone considered going into business doing this? It wouldn't be piracy as the converter could DESTROY the original disk/tape after the cart was working well. I would think that an entrepreneur could....

>make any sense...

Sure it does. Lemmings are lemmings; Beta VCRs were technically
superior to VHS units - better picture, smaller tapes, etc. and so on,
but Beta lost out in the market to VHS because VHS was marketed better.

1300. RFD: comp.emulators.{announce,apple2,c64,misc}

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-23 22:15:34 UTC
From: rdippold@qualcomm.com
Message-ID: <comp.emulators-RFD1@uunet.uu.net>
Source record: 102381
Cross-posted to: news.announce.newgroups,news.groups,comp.sys.ibm.pc.misc,alt.emulators.ibmpc.apple2,comp.sys.apple2,comp.sys.mac.misc,comp.sys.atari.8bit,comp.sys.cbm,comp.sys.amiga.misc

```
REQUEST FOR DISCUSSION
moderated group comp.emulators.announce
unmoderated group comp.emulators.apple2
unmoderated group comp.emulators.c64
unmoderated group comp.emulators.misc

This post is mostly intended to gauge level of interest. These groups
would be dedicated to programs which emulate other computer systems.
Since the machine being emulated and specific emulator are more
important than the machine the emulation is taking place on, the
proposed groups are divided by the emulated machine, rather than the
emulating machine.

All discussion should take place on news.groups. Note that you can't
vote now, you can just express support (or opposition) and argue about
the proposal. Voting, if it happens, would be a month from now.

So... would the groups be of interest to you? Do you see the need for
the moderated announce group? There's already an existing
comp.sys.amiga.emulations group which is very busy (mostly with
Emplant postings) - for the Amiga perhaps just the 8-bit emulators
(which are almost nonexistent on that group) should be discussed on
the comp.emulators.misc group.

PROPOSED CHARTERS

comp.emulators.announce: Moderated group with announcements about
emulators, emulator ftp sites, new emulator images, and emulator FAQs.
(I'm not sure if this is necessary, but given that most of the emulator
traffic I've seen so far is repetitive in nature, a low noise high
information group might be of interest to interested parties).

comp.emulators.apple2: Emulators of the entire Apple // family, such as the
Apple ][, ][+, //e, //c, and IIgs.

comp.emulators.c64: Emulators of the entire Commodore C-64 family, such as
the C-16, C-64, and C-128.

comp.emulators.misc: Emulation of other computer systems. Emulators which
are not covered elsewhere in the comp.emulators hierarchy should be
discussed here. Emulation of specific hardware by other hardware in the
same system (such as SoundBlaster card emulation by the Gravis UltraSound
card) belongs elsewhere.

BACKGROUND INFO for RFD
```

There are a suprisingly large number of emulators. Just for the IBM PC they include:

Z80 CP/M (several), 6800 with realtime O/S, CP/M-86, TRS-80 (two), CoCo II, Amstrad CPC, Sinclair ZX, Spectrum 48/128 (several), Timex Sinclair, MC68HC11 (at least two), IBM 370, Dragon32/Dragon64/CoCo, Atari 800, Apple // (at least two), C-64 (three), Macintosh, TI. All these are software only, there are also some hardware assisted products.

I know there are also several Apple // emulators for Unix and Mac, as an example of other systems, and the Amiga has many emulators. On the comp.sys.ibm.pc.games groups, there have been long and sustained discussions regarding the C-64 emulators, and I've noticed several emulator subjects spread out all over Usenet. I'd like to see this centralized.

I proposed C64 and Apple2 groups be created now because these are the two machines for which I've seen constant and widespread interest in emulators on Usenet. I expect these groups to actually generate quite a bit of new traffic, as there always seem to be a large number of surprised (and interested) posters whenever someone mentioned that such emulators exist.

Computer groups are regularly visited by people asking "Is there a emulator for x?" and then by questions about how to use it and find software. There are several emulator ftp sites, but they're sometimes hard to find. Several of these emulators are in beta stages - such a group would be the perfect place for announcements of new releases, bugs, or fixes.

An up to date FAQ is crucial for this sort of group - I would try to keep a comprehensive FAQ (or let some other poor slob do the job), and there might easily be demand for separate FAQs (such as already exist) about each of the more popular emulators, such as C64s.

Playing M.U.L.E. again! Ah, nostalgia.

1301. Ben Doesn't Own AC!

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-23 22:38:15 UTC

Message-ID: <9403232159.AA12720@phinet.smithkline.com>
Source record: 102382

Jim Gilbert is correct in stating that AC has not been profitable.
But, that was by DESIGN. AC was never intended to be a cash cow. It was
priced to enable us to produce a semi-decent mag & pay our bills. Depite
a very shaky subscription history AC scraped by on income from ads & the
unanticipated oversubscription of our Disk. But at long last we are
succumbing to a decline of our subscription base.

Jim is DEAD WRONG in stating that I am the owner of AC. Where the dickens
have people got the idea I own the darn thing??? Has no one ever read a
word I ever wrote?

For the umpteenth millionth time,

*** I D O N O T O W N A C ! ! ! ***

AC was begun by The Community! Is everyopne's memory so short? Have you
all forgotten Jeff McWilliams' Mail Campaign in 1992? I've only referred
to it about 12,000 times in mag editorials & email postings.

FOR THE RECORD:

AC belongs to the community.
I manage AC on behalf of the community.
The authority for me to do so came directly from Jeff MCWilliams.
And Jeff's authority came from the 615 people who participated in the Campaign.

Although I do occasionally enjoy a bit humor/bantering, & even an occasional
joust with one of our Columnists, anyone who thinks I'm on some sort of ego
trip with AC is WAY off-base! Emotionally speaking I am about as unsuited
to manage this publication as anyone can be, & I've even stated so in the
magazine (check my Alchemist column in the October issue). I only do it
because as far as Jeff could see I was best qualified & had the most
editing/writing/publishing experience.

There are some who don't like the way I do things, & the only excuse I
can offer is that I'm only a user like everyone else. I'm a research
chemist, not a editor-publisher-Bossman dude. I'm an amateur, nothing in
my educational background ever prepared me for an experience like this.
I studied differential equations, Fourier-Transform nuclear magnetic
resonance spectroscopy, molecular orbital theory, high-pressure liquid
chromatography, analytical-physical-&-organic chemistry, & advanced
reaction mechanisms of heterocyclic systems. None of that stuff prepared
me a whit for being the Managing Editor of a computer magazine.

But, we may soon see what happens if some other amateur were to assume
management of the magazine.

Heh.

- Ben Poehland
Managing Editor, Atari Classics Magazine
But NOT the owner!

I have some atari equipment that I have not used for a very long time.

For the right price you can have:

atari 800
millipede
miner 49'er
basic
I actually bought this stuff for $300 when the street prices
were $800. I guess I used this about less than a months time.
printer
All of the items are in good working condition.

Jim Hague states Wes Newell hasn't released a new product since the mid-'80s.

NOT TRUE!

Newell released the 1-meg upgrade in 1990. I announced it in my Alchemist column in Current Notes magazine, Sept. 1990. At the time I thought I'd never see a use for such a thing. Now I can't live without it.

But, in other respects, the statements made of Newell Industries are generally true. I regard NI as a typical laid-back Atari vendor. The dude doesn't advertise, & seems to think as many in the vendor community do that all you have to do is have a product & by some magical osmotic process millions of people will beat a path to your door. ADVERTISE??? Hah! who needs THAT? The millions of customers fail to appear, these guys get bummed out & find something else to do.

I'll say this much for outfits like CSS, B&C & FTE: at least those guys amke an effort to spread their name around & advertise aggressively.

The best product in the world is worthless if you don't tell the world it's there.

IMHO: It would be tough as something like a commercial venture. For example, new 8k roms go for about $3 each, cart making supplies run about $7, so just for raw materials you'd be into it for $10. Figure you have to mail it so it'd be another $3-5 bucks on top of that. Even if someone is willing to do it for $5/cart, there aren't that many titles that people would be willing to pay $20 for so you could break even. If somebody had a killer application that had to be carted maybe, but my friends tell me minimum runs for breaking even would be in the 100's to thousands.

That's right- I completely forgot the 2600 game console! *thud* And imagine that I used to own one... (Sorry guys, but I threw it out.) Yeah, I think you're right- The 2600 bust probably had the most impact on its computer sales, and the C64 jumped on the bandwagon at the right time, when its price was drastically reduced from 595 to around 200. But don't be misled if you think Commodore had 'marketing'- Their only tool at that time was the price reduction. All and anything else from Commodore still remains to this day, nonexistent, in terms of support, marketing, blahs, etc.
Thanks for that 'illuminating piece' about the 2600...

>point routines? I heard that floating point math is handled in the OS.

It could be a problem within the FP to ASCII conversion routines, but I
don't if that alone would account for printing an endless stream of
hearts.

I think the trace, which is likely to be pretty darn long anyway, would be
almost too long to be useful if it traced all the OS stuff. If he finds
out that the problem exists within one of the OS routines, I can always go
back and trace that part.

>Has it also occurred to you that the monitor might treat the BASIC
>interpreter as OS?

No. It uses addresses above $C000 as that test.

> GED, the Harris Graphics Editor, does not run on my 64K/48K machine.

There must be another reason. GED uses no expanded memory.

>MAE, the Harris Macro Assembler Editor, does not run on my 64K/48K machine.

It came with a file called NOTE64.DOC which had instructions on converting it to run on a 48K machine. Granted, it isn't designed to run in that environment, and even after making the changes, it isn't an optimal assembler for a non-expanded machine. I think you'll only have 17K or so of free memory for your source.

When it was uploaded to GEnie, it was listed as a program for XE compatible memory expansions. I would have thought I did the same thing here, but my appologies if that was overlooked.

Marketting is the only necessary ingredient for a successful product -- at least in the USA. Atari has never been accused of possessing this quality. At least not seriously accused.

>Also, can anyone clarify the hardware differences between C 8bits and Atari >8bits?

On paper, the C64 specs out in some areas better than the Atari8. But those differences are not that accurate in the real world. Regardless of the display specs, the video that comes out of an Atari looks a lot higher quality than that of a C64. The CPU speed advantage of the Atari, in addition to just making the machine faster, can be use to significantly boost the graphics abilities. There's a lot more flexibility in the graphic design of the Atari. That's hard to explain, and not always appreciated until you've worked with the machine for awhile, but it's there. A lot of things like the 4096 ColorView system, the GED that I did, specialized applications with mixed mode display lists, free format screen ram allocation, dynamic display list updating, etc., all show up the advantages of the Atari hardware. There are tricks that can duplicate most or all of the C64's display advantages. Like using players (sprites) with masking to get multiple colors in the highest resolution. Redefining players many times to get lots of objects on screen. And more. Whether or not the designers chose to exploit all of the available options, will often make the difference on whether an Atari product will look better or worse than a C64 equivalent.

As a Sr. Electronic technician, who has worked on all kinds of computers, INCLUDING both Atari 8bits and the infamous C64s, I can state without a doubt that, from a hardware and quality standpoint, there is NO COMPARISON between the Atari computers and the C64s. The Atari Computers were/are some of the best built and designed (although they did have some big bugs in the video circuits) computers. To this day, they are considered very quiet (rf wise) compared to others. In comparison, the C64 was about the most horrendously fabricated piece of sh-- I've ever seen ... bar none. There were no limits to the shortcuts taken to cheapen the thing. ON top of that, it is a virtual rf noise generator! Many ham operators have found this out the hard way!

No sir. There is NO QUESTION in my mind. The Atari 8bits were the best 8bit computers ever made .. even with their few faults.

To Kit Kimes,

Just out of curiosity, how small were those first PDP-11 UNIX systems? How many K of core memory was needed? And speaking of small systems, now that chips have 64K of CPU cache on board you could probably fit --ALL-- of an ATARI 6502 8-bit onto a single chip, the entire machine. Hmm... just sell a box that you have to plug a keyboard into, plug a cartridge box into, plug a joystick box into, plug a drive into, all via standard connectors. I wonder what the minimal price for a "programmable game machine" would be?

I have always been curious about who designed the original 400/800 line of computers. I have heard that Jay Minor designed the custom graphics chips in the Atari, and later worked on the design team for the Amiga. The only other name I have heard of is David Crane. Crane was an early 2600 programmer who left Atari and went to Activision. In an interview with Crane in the "2600 Connection," he states, "I was also on the design team for the Atari 800 computer. That was a lot of fun."

So who at Atari decided to start a home computer line? And how long did they take to design? Were they consciously going after some of the Apple II's market share?

I didn't get my first 8-bit until '82, three years after their initial release. Does anybody remember how they were first received by the computer press? Were they recognized as a superior product right away, or were they met with skepticism?

I realize that this may not be of interest to everyone, but after using the 8-bits for so long it would be interesting to know more about their beginnings. (We've all heard the stories about the first Apple II being built in a garage, etc.) Any information or thoughts on this?

Oh _PLEASE_. Cut me a friggin' break already! If your 8--bit is more
powerful than a 386 machine, it's for the sole reason that (a) your 386
machine is barely, if ever, used, (b) your 386 has no RAM or hard drive in
it, or (c) you have a truly strange definition of "powerful."

Just a little testy, eh? Actually, my 386 has a mere 40meg hard drive and 4meg
of ram, while my 8bit Atari has 350meg of hard drive space and 4meg internal
ram, and 256k of ram inside the MIO.

My 386 seems comparatively slow compared to similiar operations performed on my
8bit Atari also.. (I use MIOCACHE and cache out 256k).

And no, I'm not some run-of-the-mill PC owner who doesnt know squat about
computers.. but rather a computer professional who earns his living in that
market as a sysadmin for the State of Utah (Sparc10, SunOS Unix, PcBoard 15.1

1327. Antic Programs. Out on PD?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-25 02:59:00 UTC
From: kevina@clark.net
Message-ID: <2mtk1k$oso@explorer.clark.net>
Source record: 102208

Hello there you guys. Does anyone know what happend to antic online on compuserve?

Also are the antic programs out there on the PD? They had some really good programs out there. Or better yet the actual articles + source code.

In a message dated 3-23-94, Scott Coleman said:

"Beta VCRs were technically superior to VHS units - better
picture, smaller tapes, etc. and so on, ..."

They did have ONE technically inferiority, as I recall...shorter tape time. Six hours on a T-160 or four on a T-120 was a selling point. Also, image quality was even less of a concern back then, as fewer people had cable (and as an antenna user, I gotta tell ya; reception can vary from good to rather crappy from one day to the next on the same station).

1329. Re: What Good Is An Atari 8-Bit?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-25 08:11:29 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <JU7MRQR.lmcclure@delphi.com>
Source record: 102210

"It doesn't make any sense... Computer users usually goes to
the most technological platform for their money, and Atari
should have won, but lost instead."

The key is in what you said...the most technological platform FOR THE MONEY. For the vast majority of it's life, the Atari 8-bit was significantly underpriced by it's Commodore counterpart. When I purchased my 64K 1200XL for $150 in late 1983, it was a steal because that was the price the same store was supposed to be selling the 600XL (only 16K, and with no monitor output, only RF) for. In fact, there was a chance when I ordered it that I would end up with a 600XL instead ..if Atari got them out in time. Luckily they did not. <grin>

I believe the 800XL was going for close to $300 at that same store, significantly more than the Commodore 64 was selling for at the time.

In earlier years, the price differential was even worse. For instance, when the 1200XL was introduced, it debuted with a suggested retail price of around $700. The 64, which was already on the market, had started out with a suggested retail of $595.

However, I can tell you after the Tramiels took over Atari, and instituted their "Rock Bottom Pricing" policy on the Atari 8-bits, at the store I worked at, our Atari 8-bit sales were neck-and-neck with C64 sales, despite the larger software selection available at that time for the C64. Had the pricing been closer all along, I have little doubt the face of 8-bit computing would have turned out differently. Also, as others have pointed out, the technologically superior product (even if priced lower) does not always win, anyway. Marketing prowess is still a big part of the product equation, especially in the U.S. marketplace.

"Also, can anyone clarify the hardware differences between
C 8bits and Atari 8bits? For example, C=64 can display 8
sprites, whereas Atari can...?"

I saw that someone else has already replied with the specs, so I'll put it another way. The C64 does better with text-oriented applications. Just ask anyone how much work it is to TRY and use 16 different colors of text on the same line of an Atari 8-bit 40-column display. On a Commodore, it is as easy as falling off a log. The Atari excels at graphics. Try getting more than 16 colors out of a 64, or putting more than 6 of those colors in any 16-pixel horizontal segment, and you'll find it's payback time. Essentially, the 320x200 graphics mode is a character display with 1000 programmable characters. Trade off resolution for 160x200 'multicolor' mode, and you pick up two additional

colors, but your display still works like a 40x25 text display with 1000 reprogrammable characters.

For the record, I own both Commodore (since 1982) and Atari (since 1983) machines, and currently have both a Commodore 128, VIC-20, Plus 4, and an Atari 1200XL and 130XE (as well as an Amiga 500 & Atari 520STe w/4megs).

In a message dated 3-21-94 Ben Poehland said:

"Mostly because, I think, people have lost sight of the
manner in which AC originated, the magazine is faring poorly.
During the past 4 months we have gone from a condition of
being 5% oversubscribed to one of being 20% undersubscribed."

I am truly sorry to hear that. Although being a charter subscriber to
A/C, and renewed for my second year, I only wish I had the time to offer
more than simply my subscription money (i.e., a useful article or two).

"I think AC offered value for the money. Apparently the
community does not agree."

I, for one, thought the December '93 video issue was almost worth the
entire price of my first year subscription, and the other issues were
certainly not bird-cage fodder either!

"AC published "Dream Street" as an enticement to entrpreneurs.
No one bit."

I've gotta partially disagree with you on this one. While some of the
Dream Street items were products that someone should have been able
to create and market for a reasonable price, I doubt some could have
been sold for the price people would be willing to pay (i.e., an
SIO buffer for printers like the 1025 and 1027).

1331. Re: 8-Bit Markeplace (WAS: Old Games)

More to the point of this topic should be HOW is this Xwindows going to look? Obviously concessions had to be made, right?

Is there mouse/trakball support?

What is the effective baud limit you can use this at?

I've played Xwindows games such as NETTREK and although the graphics of the little ships in NETTREK could probably be ported (they are pretty simple) there is a lot more info on that screen such as a little tiny text window on the corner and all that. The workstations I was on were SUNs and seemed to have 1024x800 or so resolution, enough for 4 plates of standard VGA windows of 80x24 characters fully formed.

I really wonder what this is going to look like. You have piqued my curiosity to say the least!

: - please check back on this here next week!

: -Tim

Tom Hunt wrote a program years ago called MTOS which would multitask small programs in main 64K RAM. After experiencing the limitations of speed and memory conflicts, he eventually developed Snapshot, which, on the 8-bit, is a better idea IMHO. IN fact, some aspects of Unix and of course Windows for the PC are merely task switchers no more powerful than Snapshot on the 8-bit.

The "virtual ram" idea is as old as the hills, as old as MEM.SAV to preserve your Basic program.

These days the 8-bit is doing more and more of this sort of thing. BBS EXPRESS PRO! uses something called overlays to cut down on Disk I/O module loading.

I don't know if you are working on an outgrowth of Tom's MTOS or your own, but in my mind the only way to REALLY do a flexible multitasker is to have an alternate 64K bank which is fully addressable and NOT in 16K chunks which you can alternate to and from, and each additional app you run would require yet another 64K bank. Otherwise that would limit where programs can run from, which will limit the system's viability to mostly a programming tool.

1336. Quick

There was, at one time, some buildup of anticipation over the QUICK language. On paper, it seemed to have many unique features but it seems noone is using it.

Obviously it must have some bad flaws. I heard rumors of DOS incompatibilties. Was it Sparta incompatibility? If so that would explain it.

It did compile to direct ML which is more than Action! does.

It supposedly had all this support for DLIs and multitasking routines and stuff, it would be a shame if it just disappeared.

Flame: You IDIOT!!!

The idea isn't to run X windows on the 8 bits. That will never
happen. The idea is to run 8-bit software as X windows applications.
There is no talk of porting X to the 800. There is talk of EMULATING
the 800 under X.

(I'm not seriously annoyed. The idea of running X on the 8 bit with
all the object-oriented overhead and TV quality resolution is just
plain funny. This isn't the first post along those lines that I've
seen, but I hope that this helps clear things up.)

: column in Current Notes magazine, Sept. 1990. At the time I thought I'd
: never see a use for such a thing. Now I can't live without it.

: But, in other respects, the statements made of Newell Industries are
: generally true. I regard NI as a typical laid-back Atari vendor. The
: dude doesn't advertise, & seems to think as many in the vendor community do
: that all you have to do is have a product & by some magical osmotic process
: millions of people will beat a path to your door. ADVERTISE??? Hah!
: who needs THAT? The millions of customers fail to appear, these guys get
: bummed out & find something else to do.

: I'll say this much for outfits like CSS, B&C & FTE: at least those guys amke
: an effort to spread their name around & advertise aggressively.

: The best product in the world is worthless if you don't tell the world
: it's there.

: - Ben Poehland
: Bummed-out AC Editor

Wes was active in Fidonet and I think he still is. That is his home
base. He has also had conflicting commitments, such that Newell
Industries is not his life 24 hours a day--I can't speak for him but I
want to defend him in some manner here. If you are saying he should have
advertized in AC, I agree, but that doesn't make him some kind of 8-bit
cheapskate. His items are still available to those who want them, and
that is the important thing.

If you want a target, why not pick Chuck Steinman of DataQUE? He
bungled the T816 project, and he bungled the mv80 which would have been a
hit if someone wrote a Bobterm driver for it. Now he is selling the
Transkey which he can't claim is his own invention, and he never finished
the much touted ANSI C cartridge. He also sells the Gamelink interface
but that is mainly a premade hack like SIO2PC. I think he has the best
of intentions, but no business sense at all or the wherewithall to make
theseprojcts fly. Some people feel that these projects should be self
sustaining, but the WORD needs to get out and programmers courted
especially for hardware as radical as the T816.

Now we have this 65802 idea. To get it to work, we'd still need
a 16 bit OS, which would mean writing a new one, or asking Chuck to

release the T816 OS to the public domain. Hm. Do you think he will officially want to make a statement this way that the T816 is dead? If he holds onto the rights of the T816 OS that would be rather odd. Of course, we could ask him to offer a "T816 lite" 802 board, a simple conversion board to change the pinout and add the halt line and install an OS switch and piggyback the OS. This would be a LOT easier than what is involved in building ram off the new 24 bit bus on the T816.

Again here is an opportunity. But Chuck is not creative enough to even ask around to see if people are interested. It is pessimism or inertia or both. THese things have to be MOVEMENTS. If I come up with a T802 hack, and another place I pick up John Harris' MAE assembler and call up Tom Hunt and say "Hey, if I give you this, would you convert over some programs to 16bit fast operation or make a couple new things for it?" I think he would jump at the chance.

It takes networking and some GIVING to start the sparks on development. I have always acted as a catalyst which is why it bothers me to see some things faile by virtue of NOT any effort to develop excitement.

: probably fit --ALL-- of an ATARI 6502 8-bit onto a single chip, the
: entire machine. Hmm... just sell a box that you have to plug a
: keyboard into, plug a cartridge box into, plug a joystick box into,
: plug a drive into, all via standard connectors. I wonder what the
: minimal price for a "programmable game machine" would be?

I'm sure if Atari relinguished the custom chip schematics that the Atari could be downsized to a calculator sized machine if need be. Even the XEGS shows signs of this since it only uses 2 RAM chips and the OS ROM has the OS, Basic, and Missile Command integrated.

But you'll never see it happen unless Atari gave us the schematics so the VLSI(sp?) chips could be further downsized into one chip.

People have talked about trying to make an 8-bit into a notebook, that too is doable, but only if there is such thing as a low power 6502. I know of none unless maybe what they use for the Lynx/Gameboy is compatible. Maybe that and STATIC RAMs could be used. All dream stuff of course.

If PC Xformer is all it is cracked up to be then we will be able to run 8-bit emulation from a color notebook PC.

Your treatment by CSS was no fluke. This is their standard mode
of operation and it is wonderful. You simply DON'T get that kind of
support anywhere these days. It seems there are 2 views on CSS. Some
people just say "the stuff costs too much" and don't get involved. Other
people get hooked on CSS stuff and the wonderful support they provide and
to the latter, the cost of the hardware is paid back in full by CSSs
courtesy and very cheap labor costs. In my experience, Bob has not
really charged me for labor on CSS hardware, not even stuff I bought used
like my Black Box and Multiplexer. Only for new parts and he only
started charging for upgraded ROMs recently cuz I guess he was losing too
much money giving them away. He also charges for shipping, big deal. It
is good that FTE is back because when ICD was gone, noone could offer
service to MIOs and the like. ICD did do work on occasion but it was hit
or miss and VERY expensive. I gave an R-8 to a fellow sysop and it had a
broken trace on it and the guy wound up getting gypped when he sent it to
ICD to get fixed. I think he was charged like $20-40 or something for
practically no work. Now THAT is what the norm is, not the CSS way of
doing business. Of course, Bob's hospitality over the phone helps too.
There is nothing worse than a pissed off voice over the phone.

I wouldn't suggest this to everyone, but one time I was
experiencing a wierd lockup on my system and en passing I mentioned this
to him and he said "Why not enter your MUX ML monitor" so I did, and he
told me to go to various addresses. Within 10 minutes by me merely
relating the hexadecimal figures, he had diagnosed my problem: That I
had set MYDOS for too many file buffers. If that isn't a feat befitting
a GURU I don't know what is! He also got my 1400XL working wth voice
with the MUX which I thoght was NOT going to work.

Actually, you haven't needed to use the Action! cart to run programs since at least around 1984-5. I balked at paying the $30 or so they were asking for the runtime package. I'd already payed $70+ for the cart & another $30 or so for the tool kit, but Action! was always meant to develop stand alone programs. My Action! programs started making the rounds when I found the PD runtime package on CI$. Stuff like HomePak, Express, Preppie, Food Fight, & XE Term were all done in Action!.
I don't know what the full Quick package cost, but I think FTE reduced the price of Action! to $50 with the toolkit or RT or both included.
IMO: It's still the best programming language for the 8 bit. The *ONLY* thing I wish it included was an option to output ML source code so you could go back & hand optimize the code. Most 'C compilers let you do this for time critical sections, but then Action! pretty quick anyway & lets you add code to your program anyway.

This is for Todd who has been a C=64 user for 11 years & has at last gotten the good sense to inquire about the Classic Atari. Better late than never!

Most of your questions should be answered in the next FAQ list posting, which Michael Current of the Cleveleand Freenet sends in about once a month.

Also, a new column for beginners just started in the February 1994 issue of Atari Classics Magazine. It deals specificially with folks in your situation who are new to the Classic Atari & a bit bewildered by the various models & products available for them.

A back issue can be had for $5, to:

Ben Poehland
179 Sproul Road/Rt. 352
Frazer, PA 19355

Oh yeah, I'm that "chemical engineer" you mentioned. I'm a chemist, actually.

Uh, I'm also the Managing Editor of the magazine. :)

1346. Atari 2600 Emu. (sort of) posted to alt.games.video.classic

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-27 21:37:37 UTC
From: ahrens26@wharton.upenn.edu
Message-ID: <ahrens26.45.0@wharton.upenn.edu>
Source record: 102227

In case anyone's interested, someone posted the source code for a beta release of an Atari 2600 emulator to alt.games.video.classic. I looked at it earlier--when you UUdecode it, it will create a file called EMULATOR or something like that. You have to rename it to a .ZIP extension, and then PKunzip it.

Apparently it runs on Xwindows and is still in beta mode, but it might be interesting for the source code included.

Please don't ask me questions about it because I'm not the original poster. Just wanted to let everyone know.

1347. Re: Antic Programs. Out on PD?

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-28 00:02:20 UTC
From: jomcgow@eis.calstate.edu
Message-ID: <2n56qc$a84@eis.calstate.edu>
Source record: 102228

While Antic folded, and the programmes are not in the public domain, they have permitted their posting (as has compute! for their old 8 bit programmes)... I believe you can find a complete set of antic disks in ARC format (and many Analog disks) on GEnie.

Hi Folks ,
Have a question here someone may have come across before.
(This is for a friends set-up). He is running a Moniterm 19" (194 Model)
high res mono screen on a Atari Mega. He has had some problems running
some applications on the big screen and was recommended to get a program
called "xmon" (Written by a Don Wheeler ?). This apparently centres any
programs to the screen allowing them to run like on a 14" screen. I've
tried to find the program on the ftp sites but as yet have been unable to
find it. Does anyone know of where I might find this program or any
similar programs which do the same thing (Preferably via ftp).
He has been running bigmon but it does not seem to work with
programs wanting to see a smaller monitor. Bigmon I think is an Atari
product?

Any info appreciated!

Cheers

David

1349. 1200XL Schematics...a quest for knowledge

I knew SOME wiseguy would come in and correct my little history lesson <BIG GRIN>. Yes, I knew there were some inaccuracies in it. I have only heard the rudimenary parts, and would be greatly interested in learning more from those who know.

>The 8080 was always an Intel product.

This is, of course, true. My main point being that the 8088 didn't make significant improvements over the 8080.

>More modern designs tend towards remapping all of memory, much more flexible.

My point exactly. The 68000 started out as a "more modern design" than the 8088/8086/etc.

All this is very interesting to me, and I would like to learn more so that when I tell this story, I can get it completely correct for a change. <g> Is there any book or anything that gives a history of microprocessors?

Message-ID: <2n5rk8$25f@pegasus.cc.ucf.edu>
Source record: 102234

: The main reason I want to get it to go again is a game called Crush,
: Crumble and Chomp! I've lost the box and the manual, but I still have
: the tape. It is copyright 1981, and was made by Automated Simulations
: of Mountain View California. Imagine you are playing Sim City, but
: instead of building the city you get to be the Godzilla monster that
: goes around and destroys it...

Great game. I remember playing it. And I'm sure I still have a copy on
Disk. Wasn't it written in BASIC? I can't remember that aspect.
It was also called something like "Crush, Crumble, and Chomp -- The Movie
Monster Madness Game" wasn't it?

: I've seen 800XL's advertised for sale in a local paper. Will an 800XL
: be able to run C,C & C? And how about my cartridges? I have the 410
: program recorder, will I have to replace that as well? (the 400 is, as
: far as I can tell, pretty dead).

Yes, an 800xl will probably run Crush, Crumble and Chomp. Although, don't
quote me on that -- I ran it on an 800 at the time and have yet to try it
on my 130XE. You might need the TRANSLATOR program?

: I'd be interested in hearing from anyone else who remembers Crush, Crumble
: and Chomp! If anyone has a copy, with manual, I'd be interested in buying
: it on floppy (or can I transfer the cassette to disk?)

You can try to transfer the cassette to disk. I've done it before for
other programs... It depends though, some cassettes were "multi-load"
meaning part of the program was loaded into memory and then addition
parts as needed. The program I had to do cassette to disk transfers
couldn't handle this.

1354. Demise of Atari Classics

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-28 06:49:51 UTC
From: theclub!conklin@egr.msu.edu
Message-ID: <9403280635.AA13520@theclub.mi.org>
Source record: 102235

In a recent message, Ben Poehland writes again about the problems with
Atari Classics and the people who originally subscribed and either never
subscribed or dropped their subscription. This isn't the first time,
and since it covers 'misperceptions' I'd like to clear a few up.

> In following this thread I see the same old misperceptions that are
> strangling Atari Classics.

> FIRST: Ben Poehland did not start AC, THE 8-BIT COMMUNITY DID.

This is true. Atari Classics was originally a community discussion gone real.

> ... Instead, we are being treated like any other commercial entity. I tried
> to make that point a year ago in an editorial called "Us Guys Iz Yooze Guys".
> I now know that editorial was a waste of time

Atari Classics IS a commercial entity - period. You charge $$$ for a product.
How it started was irrelevant. What makes one think Life magazine didn't start
as a discussion at some church meeting? That's how things get started.
Continually, though, Ben has acted as if AC deserves some special treatment
because it created in response to a widely discussed need. As is most anything.

> 2nd : AC was founded to be non-profit.

And? So was the YMCA & the CNEPA (Certified Netware Engineers' Professional
Assoc.) The head of CNEPA is bucking for $125K/year.

> the magazine is faring poorly. During the past 4 months we
> have gone from a condition of being 5% oversubscribed to one of being
> 20% undersubscribed. We are foundering. This is not a case of the
> community failing to support a vendor. This is the community failing to
> support ITSELF!

No, it's not. It's a case of subscribers not wanting the product at the
price. That includes me. My case may be my own, but statistically speaking,
it probably is representative.

The number one reason I dropped AC in two words: Ben Poehland.

AC may have been started by community, but it quickly devolved into a
personal stage for Ben. This isn't necessarily a crime, if the personal
speech is worth hearing, but I quickly found it was not.

Many of Ben's own articles were not of sufficient value to keep my
interest as a subscriber. The diatribe "The Saga of the AC database" was,
honestly, pure drivel. I reread it before posting this just to make sure I
wasn't hasty, and it's still bad. Given how Ben's material tended to
dominate the magazine, it became a primary factor when I was asked to shell

out $$$ again for more of it. No thanks. There aren't enough pages to be wasting on this stuff.

Another primary problem was a lack of professionalism in the editing of the magazine, specifically concerning Ben's own articles. If Ben writes something, he writes it as fact. Fine, but then don't be wrong. Which he was.

A good example is the Super Video upgrade. Even in the last digest this was presented as a Wonderful Thing. It's not. Having done the upgrade, correctly, I found out the hard way that it's NOT an 'improved' video, it's an ALTERED video. I did NOT find the alteration an improvement, as the supposedly improved clarity was actually nothing more than artificially boosted brightness levels, typically on the trailing edge of characters.

Some people might _interpret_ it as improved video. I did not. A more professional reporting of the upgrade might have had a panel of reviewers or a third person give their input. Certainly, I wouldn't have recommended (and DON'T) doing this "upgrade" to your own machine. And I _sure_ as Hell don't brag about having a machine with Super Video 2.0 as some 'feature' akin to the Newell 256K board or the like.

This same theme, of Ben making basically unsubstantiated claims, became par for the course. Since I knew at least some of the material was not reliable, essentially none of it could be trusted, lowering the value to near zero for a significant portion of AC every month.

AC has other problems. An awful lot of coverage of old news. Daisy Dot III, for example, is older than god. So it's the best thing out. I don't care. Just more wasted pages. If it's a NEW magazine, lets hear about NEW developments. Or at least newer. Transkey, Turbo-816, the new fully static 6502 which should make turbo Ataris possible, Bob's IDE interface project, the cc65 Unix cross compiler, this X-windows Atari emulator --- these are the kinds of materials I would expect in a current publication.

AC smacks of a handful of guys putting together a magazine, which it is. That's no crime. But if you expect me to BUY your stuff, then you have to take it beyond yourselves to a more professional, detached, informative publication worthy of the hard earned $$$. I paid as much for the Deep Blue Secrets disk as I did for the mag. Next time, no mag.

> 615 people pledged to support AC. Fewer than half honored the pledge.
> The rest all got a free magazine, paid for by the truthful half of the
> community. What does that say for us?

Ok, so this pompous nonsense didn't exactly endear me either. Shut up, please.

> Just my $.02.

It's been more like $20. If it was $.02, I'd still have a subscription.

>than that of Commodore's 8-bit machines, yet they were outsold 3:1? It doesn't
>make any sense...

Sure it does. Lemmings are lemmings; Beta VCRs were technically
superior to VHS units - better picture, smaller tapes, etc. and so on,
but Beta lost out in the market to VHS because VHS was marketed better.

No, Beta lost mainly because Sony charged more for the license, which
ended up (after margins are added) with a significantly larger price
tag. You can tell the difference in quality, all right; it's just
that when the rubber hits the road, people make the decision based
mostly upon price.

Ataris lost, I think, first because Apple gave AppleIIs away to
schools so the kids came home thinking that's all there was, but
eventually due to price. By the time the price was significantly
reduced, however, the war was over.

When I bought into Atari, it was for the games. It was when the local
Kmart unloaded their old 400s for like $40 each. The 65XEs were cheap
the next year, so I upgraded. I guess I'm as cost-driven as anybody.

Also, I have heard it said that Ataris were easier to make copy
protection more effective, and folks bought Commodore because there
was more pirated software. I'm not so sure I believe that, but who
knows.

>Computer users usually goes to the most technological platform for their
>money...

Sorry, I'm afraid I'll have to disagree with you on this. Look at the PC clone market. Even Apple is beginning to have trouble holding their ground against "Intel Inside" marketing.

The Intel 80x86 series is not the most technologically advanced thing out there. Look back at the original history of the chips, and you will see that the 8080 is the foundation for both the Intel line and Motorola's 680x0 line.

I have used both processors extensively, and I would say that statement is pretty far from what I have observed. The differences between the 8080 and 6800, even, are quite extensive. I would say the 6800 annd 6502 are similar, and the 8080 is off in left field somewhere.

The x86 are more like the 8080. It is a terrible shame IBM chose it during that critical period - this decision has probably cost the computer industry more in programmer hours that any other decision in the history of computing. If those designers had had any idea how far-reaching their decision was to be, they undoubtedly would have waited the several months for the 68000.

Motorola decided to design a completely new chip with some of the nicer features of the 8080, but without some of the drawbacks. Thus the 68000 was born.

The 68000 grew out of the 6800; the 6800 was on pretty much a separate evolutionary path from the 8080. (Someone at Motorola would probably be highly offended by your statement.) Really, I am not just flaming here, but the 8080 really doesn't have any nice features. Get a copy of the instruction set and try to code something up; then try it on the 6502 or 6800. You'll see what I mean.

The later Motorola chips bring the full 32-bits of the address register outside, and thus have 4 Gigabytes of addressing space! (ouch).

All versions of the 68000 have a full 32-bit flat, linear address space. The earlier ones didn't wire them all out, because they figured at that time, which was correct, that almost no one would have a memory space larger than 24 bits. (late '70s).

Now, I'm not trying to start a processor war, but I am simply trying to point out that people are crying "Intel Inside" not because it is the most technologically advanced thing, but because a) there is a large software base and b) there is a marketing campaign going on to promote the platform.

Yes, it is a marketing scam. Sadly, it is working!! People actually think that sticker makes one PC better tahn another. It is so easy for skillful marketing to create perceptions.

Actually, I tend to think that Unix (in all of its flavors) is a more widely used OS than MS-DOS, but at least Unix is capable of running on newer and more technologically advanced platforms (Motorola 680x0 series, RISC processors, etc.).

No, it is another terrible shame but MS-DOS is by far the most-used operating system. I will be forced to use it on my 486 until GEOS comes out with a CD-ROM driver.

Load MyDOS, press 'O' for the configure option, then press return a few
times, watching what the screen says. After one of these keypresses, it
will ask if you want to setup a default RAMdisk for whatever size it thinks
you have. Keep pressing return to do just that. The number of "K" you
have should be reliable if it's an ordinary upgrade.

1365. 800XL w/256K ramdisk problem

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-29 04:41:58 UTC
From: CSCHRAME@silver.ucs.indiana.edu
Message-ID: <CSCHRAME.7.0017B3BD@silver.ucs.indiana.edu>
Source record: 102246

Hi,
I have an Atari 800XL with a 256K ramdisk I purchased for $40 from a friend, probably about 6 years ago. I used it for my bulletin board. There always was a problem with it though. If you didn't use it often, then powered it up and turned it off, you would have to wait about 10 minutes to use it again. For example, you turn the computer on, use it for a while, and turn it off. Now, you want to turn it on again, but your screen is blank. (blue actually) All I could do was wait until it came back to me. Now, if I used it frequently, the problem would disapear.
I always thought that was odd. I would think it would do that from overheating or something from prolonged use, but actually more use eased the problem. It still does this. I know you always were supposed to wait like 5seconds before rebooting the computer, but 10 minutes is an awful long time. Any thoughts about what could be the problem? Thanks.

The funniest thing about the Microsoft Arcade pack is that you need a
486 for the games to run at an acceptable clip. I'm sure the
programmers of the original Centipede and Missile Command get a big kick
out of that.

>(hopefully) get the change to occur exactly between lines.

This really brings back memories too. I was going to do the Frogger conversion to the C64, until my breakup with On-Line put a halt to it. I remember reading part of the C64 technical docs, that talked about storing values in hardware registers, and then x micro-seconds later storing it again in case the first time didn't work. :-) I loved that one.

Just as well I didn't have to do it. The 40+ colors wouldn't have converted too well.

Source record: 102252

Two new item just sent to the New directory of the Archives at Umich.

Qwk8, the qwk reader for stock 64k Atari's along with the source code and a version that runs under SpartaDos 2.3 has been sent to the archive. Qwk8, written in C, has many of the features one looks for in an offline reader and even though it's limited to 64k of memory, it's very fast even when used from stock 1050 disk drives. Qwk8 supports screen withs of 40 and 80 column, as well as outputs of 40 and 80 column. Not having a XEP80 I was not able to see if it would be supported.

Sio2Pc 3.18i, the current release from Nick Kennedy. This is an MsDOS file in self extracting format. Included is all the docs needed to build and run Sio2pc. For those who are interested, the docs for Sio2PC were also sent to the file in Atari format under the name SIODOC38.arc

Nick Kennedy is still supporting his product, currently the kit sells for $35 and an assembled unit sells for $50. And for those interested, he is looking into supporting the much requested modem passthru.

1378. December AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-29 22:32:56 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9403292212.AA22792@phinet.smithkline.com>
Source record: 102159

I'd just like to thank Lonnie McClure & Bill Somrak for the kudos on the December '93 AC special video issue. Planning for that issue began a full year in advance, including personal conferences with Bob Woolley in late '92 & early '93 (by good fortune his employer sent him to their facility on the east coast a few times, which is only a few miles from my house).

I worked harder & longer on the December '93 issue than any other 3 issues combined. Several minor typos in the hardware hacks have surfaced, clearly the work of bleary-eyed Editors who stayed up too late.

Sadly, all the enthusiasm in the world can't compensate for paid subscribers. AC was founded to be financially sovent upon its subscriber base alone, whatever we got from ads & disks was "cream". It wasn't until I had completed production on the December issue & was busy generating an updated mailing list that I realized we had lost 25% of our reader base while I was busy for 6 weeks on the December issue. Having devoted so much effort to that issue, it was a crushing blow to then have to turn around & tell our publisher to cut the press run by several hundred copies. The emotional shock just clobbered me.

One of the many ironies in the saga of the Atari 8-bit.

> --
> Harald Schoenfeld (IRC Nick: Equinoxe) | If he's your friend
> Harald.Schoenfeld@rzmail.uni-erlangen.de | you don't need enemies

OF COURSE! Just use the RAMdisk as a place to save the file! Whenever I boot up with Action!, my steps are as follows:

insert Action! cart
turn on Drive 1
insert MyDOS disk
turn on computer
go to the monitor, exit to DOS
format drive 9
copy D1:DUP.SYS to D9: (so I can jump to DOS QUICKly)
set drive to D9:
exit to cartridge

whenever I save, I just go [Shift][Control][W]rite - type [RETURN] (to save with the previous name)... easy peasy from there on. Even when rebooting. To REBoot (WITHOUT powerdown):

have MyDOS disk in
reboot computer (coldstart - [Control][Func4] is my coldstart key :))
go to the monitor, exit to DOS - hit [BREAK] a few times so it starts DOS from drive 9
set drive to D9:
exit to cartridge

takes VERY little time.. unlike these 5-10 minute boots on Macs and IBMs :)

From: Krishna@tiac.net
Message-ID: <2nagu2$636@sundog.tiac.net>
Source record: 102162

I too am curious about the development of the 400/800. To anyone with half a brain the 400/800 was graphically more advanced than the Apple][. But in a way, this caused a reputation of the 8-bits as ONLY "game machines" in a computer box, which persisted to the day when, after Nolan left (long after), AtariCorp finally created the final insult to those who were living with this stigma, the XE Game System.

The XEGS was marketed as a game machine so Atari had pretty much given up in trying to prove that the 8-bit was a true computer. However, that is not to say I hate the XEGS, I just hate what it stands for. I am actually running my PRO! BBS on a multiplexed XEGS and if that doesn't prove that the thing can rock and roll like the best of em I don't know what does!

The present owner of Carina, David Hunt, claims to be one of the Atari designers way back to Pong and he told me some anecdotes about the "loner" nature of Jay Miner and the naming of the custom chips. According to David, the chips were named after Nolan's kids, and NOT after Atari secretaries with big boobs. He essentially says that the creation of the Atari 8-bit was almost a lark, that they indeed were going to sell it for its game potential and computer potential was an afterthought. In the late '70s the "home computer" was the IN thing and everyone and their brother was jumping into the bandwagon, so Atari was stretching a little to go from the Game world to the computer world. It is NO coincidence that Star Raiders sold many of the initial machines to the public. Imagine if X-Wing was the first PC product.

It seems almost an ACCIDENT that the archetecture they decided to go with which was good for games also created in general higher throughput than machines who spent more time updating their screens like the Apple][. In the process of assigning tasks to separate chips a rather than using brute force, by applying this principle across the board the byproduct of this was the PIA and POKEY system which combined with the way the OS was written creates probably the mos flexible I/O imaginable. How else would I be able to run a hard drive through the cart ports of my XEGS and 1200XL if it were not for the flexibility of the design?

At the time all computers except game machines, and even some game machines, had nothing but maybe 1 or 2 graphics modes and some didn't even have a true text mode. The number of serious applications for the Atari which have benefitted from PMGs and DLIs is enormous. Mouse pointers, changing text bar status window colors, mixing a large text mode with a smaller text mode, mixing bitmapped modes with text modes, it all helps.

This is especially helpfull when developing terminal software.
Before the days of high speed modems this was not a factor, however, the stock text scrolling of the Atari is rather slow, but this is highly misleading. The capability of the Atari is far beyond the stock scrolling speed. It wasn't until the Express cart and Bobterm that custom scroll routines were used to allow up to 19.2K text scrolling. This now standardized technique is being applied to FlikcerTerm80 to allow 14.4k baud scrolling in VT100. These tricks have MANY serious applications and all the other machines can't do them.

Other machines have their merits, the TI processor has 16-bit internal which they can be proud of, the CoCo can run OS/9, the Apple has a HARDWARE solution for just about everything, and the C= has 80 collmns and more with the 128. I can respect those people who use those machines too. But coming from a game perspective as I did via the 2600, the Atari is equal in its entertainment factor and its workhorse factor. With some of the other machines mentioned, their gaming potential lags way behind their utilitiarian functionality. A computer has to be fun for me because that is how I grew up, playing games and doing work on the side. There may be a zillion Apple II and C= games but most of them pale in comparison to the Atari. Just compare Elite to Star Raiders for instance. And the CoCo has a DUMB analog joystick and like 1 sound voice. Etc...

: MONEY. For the vast majority of it's life, the Atari 8-bit was
: significantly underpriced by it's Commodore counterpart. When I
: purchased my 64K 1200XL for $150 in late 1983, it was a steal because
: that was the price the same store was supposed to be selling the 600XL
: (only 16K, and with no monitor output, only RF) for. In fact, there
: was a chance when I ordered it that I would end up with a 600XL instead
: ..if Atari got them out in time. Luckily they did not. <grin>
:
It seems quite a few people bought into the 1200XL when it was treated as
the "Edsel" of the 8-bit line when the true XLs came out. That is when I
got my 1200XL via Computability I believe. I felt bad about it not
having a totally compatible OS or a PBI for a while, and I got an XE in
87, but since then I've gotten beyond that after discovering the various
mods you can do on the 1200XL. After I got the MUX I can pick and choose
based more on the feel of the keyboard than whether it has a PBI or
banked ram. Banked ram can be added. In that kind of situation, the
1200XL has NO equal unless you throw a Transkey on a true XL or XE.

: I am very interested in this diagram. Could you email me a copy also?

: B. Riensche

I could use it too, it will probably be the only way I will be able to successfully do any mods on my 1200XL. At one time I tried doing Bob Woolley's clrpic2 but couldn't find a certain component and gave up.

By the way, in response to another's comment on the SuperVideo XL video upgrade, I think that is way out of line. God knows the 1200XL video is piss poor and the true XLs don't have chroma so no matter what someone's taste is, the video is gonna look a ton better with SV 2.0. For XEs the necessity for the mod is pretty nil, but that is a different story.

Ben put a ton of man hours in developing the video mods and if there is anything which he should be given unanimous credit for, it should be that.

1385. MSDOS 8-bit emulator?

: bugger at all, but it makes me throw up when I think about everything
: the Atari does with only 48K!!! I still think the Atari 800 runs
: circles around most PC games! Has anyone seen the Microsoft Classic
: Games release? I couldn't believe seeing the old Atari games
: emulated on a PC!! It was funny as hell that Microsoft is charging
: money for people to run Atari 8-bit games!
```

The wording the guy used was very misleading. He said something like the "8-bit Xwindows emulator". This can be interpreted as both an Xwindows emulator for the 8-bit, or an 8-bit emulaor for the Xwindows environment. Obviously the latter is more plausible. However, it should be noted that Xwindows in regards to remote terminals is primarily not much different from dedicated game terminal software used by pay services like GEnie, or ANSI/RIP stuff. Xwindows can also be considered a Unix extension to the OS. It is obviosly POSSIBLE to conceive of a limited emulator to allow an 8-bit to run Xwindows games. Not likely at all, but POSSIBLE in a very very limited way. So that is why I posted, this being an 8-bit newsgroup I was defaulting to bringing things to the 8-bit type of thinking and not bringing the 8-bit to a more expensive platform.

If someone says "The 8-bit emulator FOR XWINDOWS" the meaning is clear. So I can only blame the wording for creating some confusion here.

To say "The Xwindows emulator FOR THE 8-BIT" can mean only what I thought it meant.

Ouch! Scathing words.

Quick question for you.. considering your complete dislike of AC -- did you bother to submit any articles on topics like XWindows, Turbo 816, static 6502, etc..?

If not, then you only have yourself to blame, as a "handful" of non-paid staff members couldnt possibly write all the ariticles that you obviously wanted to see themselves.

Like ANY decent publication, good articles came from the readers themselves, and good articles WOULD have been reimbursed with a $25.00 stipend for the authors efforts.

Given enough time, AC would obviously have gotten around to putting forth excellent articles like the few you mentioned, but unfortunately, we may NEVER now see those new hardware hacks, etc.. in published form.

Actually, what was CW was the first microprocessor was invented at Intel by a team led by a guy named Hoff I believe. What really happened,

& it took a patent suit/court case to prove it, was a guy came up with a breadboarded microcontroller for tool control & went to Intel to have it done as an IC. One of the Intel guys, a name like Zaragosa, really did the most of the work, but then he went on to form Zilog so when Intel had to revise history, he was more or less left out along with a Japanese engineer that was working on the project. A lesson to be learned: Tow the company line & eventually you to may get credit in the press for other people work.
IMO: The Intel vs Motorola chip design boils down to: Intel chips started off as pocket calculator chips, Motorola as scaled down mainframe computer architecture. Nothing wrong with either design philosphy, both have their merits, & now the differences are more or less gone. Only real diference left is memory mapped I/O on the Motorola stuff.

Mike,
As the author of QWK8 I would recommend to all that they avoid the sparta 2.3 version of QWK8 ... it represents a failed attempt to resolve the question of the difference between atari note & point and sparta note & point. It uses up buffer space needlessly. Version 3 offers max buffer space. and works with everything the other version does. The only thing neither work with is the spartados cartridge...which I don't understand why, but thats called education folks! If I get any other reports of bugs I will gladly rewrite. I should mention that there is a bug in the QWK8NEW version I believe but it only appears when you load in a message larger than available space... all you need to do is go back to the first menu and start over (which resets the buffer size to a correct value). I would recommend the source code as a demo of dynamic storage allocation on the 8-bit...derived from K & R.

I've heard differently about how Atari lost to C= in the 8 bit arena...

According to a interview with an ex-Atari employee, both Commodore and Atari were neck-and-neck in sales. Atari was planning to move their manufacturing to the Far East, and in doing so, started to shut down their domestic plants. However, the Far East had problems and the premature shutdown in the states created a shortage of Atari machines. During the Christmas holiday season, people saw loads of C64 machines on the shelves... Atari never recovered.

In fact, both the compiled front ends for the the Atari and MsDos machines
along with the C and Action! source's are at the Archives. If I recall
rightly, they're located in /8bit/Telecomm thought you may want to get
the 0index file which lists everything in the archive.

Re-Packaging of old ideas?? Considering that FTe has only been actively
supporting the Atari 8-Bits for just a few months I feel very disappointed
that Ben has forgotten that "A replacement for the R-Time 8" was one of
the products in "Dream Street" from DAY 1... It has been shipping since
mid February... There have already been a few bug fixes in the MAC65 and
Action! Cartridges, and considering that NOTHING had been modified in them
for the last 10 yrs, at least it's a start...
I just wanted to say this... Give FTe a few months just to get the ball
rolling, and if there isn't anything NEW by then "feel free to take your
best shot" (How long did it take you write AC's Business Plan Ben??)

As a general suggestion for peoples bit buckets, in the past I have
cleaned up a lot of TV interence from computer HF signals by using
a noise filter designed for filtering out CB interference, ie --
a high pass filter. The one I've used is for 300 ohm, from Radio
Shack.

This may or may not help, as I have no experince with the spcific
configuration of hard drives (and BlackBox I presume) on an Atari.

I forget your precise original query here, and it has expired from our site, but as I recall you want to hook an IBM style RGB monitor to your Atari. The ONLY way to do this is with an external Composite/RGB or ChromaLuminence/RGB converter. The reason for this is that the video circuitry in the Atari generate Chroma and Luminence directly, then combines them for Composite.

The cost of a converter would more than likely be more than the cost of another monitor. If you want to pursue this option, there have been some construction articles in recent (last 2 years) issues of Radio Electronics for a Composite-RGB converter.

Now if you have an EGA or CGA IBM monitor, which only has digital rather than analog inputs, you are on your own. ANd I don't think I would be happy with the results, though I know how I would proceed. Take a Composite to RGB converter, then feed the analog inputs into comparators. But you would lose all shading information. And costwise, see the preceeding paragraph.

In summary, for a multiscanning type VGA display, it is possible with an external converter. With an EGA/CGA display, barely possible.

This of course assumes your monitor can handle the scan rate of normal video signals. Some don't. Then you could do it with a scan converter (big big bucks), as well as the other converter.

If I recalled the question correctly, these are the choices you have.

Hi,

not too long ago there was some discussion about splitting up the group possibly to 68030 and 68000 or to make new TOS newsgroup alternatives. However I am wondering if anyone of you are interested in creating a

comp.sys.atari.st.announce or maybe just plainly comp.sys.atari.announce

whichever..may as well stick to the st notation...(?)

The reason why I ask this is as follows, though there are quite a few new things released for the Atari concerning also commercial produce, very often so people do not like it...i.e. it is often frowned upon when people do press releases into a public newsgroup. This is why very often computer newsgroup have posted an announce newsgroup...so that people are more free to announce new stuff...basically invited to, and I think it is beneficial to both vendor and/or user. Also, he can of course choose not to read it...:) nothing unusual

Discussion would then be continued in this newsgroup if it was about an announcement..the announcement would be solely used for pure and simple announcing of any product related atari computers (or clones).

Watch'a all think?

Thanks for any input

Yat

ps: If this appears to create enough interest, i will go ahead and start

I don't if it's just me or what, but since the IA8 Digest started up again there seems to be a recurring problem where part of the text of one message is overwritten by the header of the following message. I've noticed this any number of times the past few weeks, & of course it only happens on messages that I'm particularly interested in reading. :(

Dunning had some method of stripping out all the header junk in the messages, which no doubt rendered the Digest more economical for folks who pay by the K.

Anybody else notice this overwrite problem, or am I just in the Twilight Zone here?

These recent posts by Richard Dell & others got me to reminiscing about the "early days" of hi-tech & recent developments at Intel. For example, the dude who founded Intel, Robert Noyce, died last year. The man lived a fascinating life. Back in the '60s there was a big fight over who invented the IC. The thing was finally settled with Noyce & Jack Kilby of TI being declared co-inventors of the IC.

Noyce fell in with a group of engineers who left Beckman Instruments in the '60s & bought up a failing outfit called Fairchild Camera & Instrument which they turned into Fairchild Semiconductor. Fairchild was really the fountainhead of of nearly all of today's big-time semiconductor companies, the company got rich fast & spun off oodles of other hi-tech outfits. They pretty much founded the whole concept of TTL logic & mass-marketed it in the '60s & '70s. One of the people who left Fairchild to start his own company was a guy named Charlie Sporck... his company is National Semiconductor.

After 10 years Noyce was losing control of things at Fairchild & the company was losing its competitive edge due to a severe case of "brain drain": any engineer who could sought a job at Fairchild as a steppingstone to a much more lucrative position at one of the other big semi or related hi-tech manufacturers. By 1970 Fairchild was almost gutted.

So, around '70 or '71 Noyce left Fairchild & founded Intel. Their first product was a chip called the 4004, a 4-bit MPU. Then quickly followed the 8008, & the various improved flavors of the 8008-- the 8080 & 8086. The 8088 was produced at the request of IBM, it being a cheaper version of the 8086. Intel also invented the first CMOS DRAM. During the period 1965-1975 most computers still used "core memory"-- thousands of little ferrite beads strung by hand with wires running thru them that magnetized the beads in direction or the other to represent on or off bits. (Amazingly, the Space Shuttle still used this kind of memory until its computers were upgraded in the wake of the Challenger accident.)

Intel had a lot of innovative products but really wasn't doing so hot financially until IBM came along in the early '80s. It was the mass-marketing of the IBM PC the catapulted Intel into high gear CPU development. The 8088 may be thought of as an "SX" version of the 8086. There WAS a 186, but the appearance of the 286 came so quickly & was so much better that very few computer makers ever utilized it. (The exception that comes to mind is Radio Shack, some piece of overpriced junk they sold had a 186.) Today's installed base of Intel architecture is still mostly 286 & 386. The 486 is what's supposed to be "hot" today, but the 586 is still too expensive for most users. I have heard there was a 686 in development at Intel but was scrapped in favor of an even more advanced chip, the 786, since apparently the engineering developement moved even faster than Intel's own marketing could keep up with,

& pentium sales are moving slower than Intel figured.

Probably not many people have heard of Robert Noyce. But virtually anybody who uses ANY kind of computer owes something to the genius of Noyce. He was behind the whole mad rat-race the computer scene has become. You'll occasionally see Fairchild logic chips in Atari 8-bit computers. I'm not sure if Mostek was a Fairchild spinoff; Atari used a lot of MosTek CMOS 16K & 64K memories in the 8-bit computers & videogames. But take any computer, you'll find all kinds of pieces in it whose developement can be traced to Noyce in some way. Sometimes when I start thinking about all this stuff it just totally freaks me out.

I just saw Andrew Heller's post about the 1400XL.

I got one about 6 months ago myself. Mine, however has no wire-wrap in it: it's a full-production PC board, very clean. About a zillion chips. With speech synthesizer & modem built-in, also some sort of connector that looks like it should go to a disk drive. I got no docs, no schematics, no manuals, zilch. Haven't made much progress. Is there ANY info to had on this beastie? (Other than my comments about its horrible video circuits in the Dec. AC.)

Any software to drive the speech thingie?

Any software to operate the built-in modem?

And... god forbid... SCHEMATICS ?????

I know an Alchemist who could make good use of such info....

(Note: this is the 1400XL, not the 1450XLD.)

Nice to hear someone else fascinated by the tree of development.

Just to add to the lore a bit ... don't forget the root of the tree, one
of the designers of the transistor, William Shockley. Out of Bell Labs
(of course <grin> one of the fellows I used to work with was ALWAYS ranting
on and on about how AT&T sold the rights to the transistor to Sony for
$50,000 back in the 50s), he left and by way of CalTech ended up forming
the Shockley Semiconductor Laboratory at Beckman Instruments in 1955.
A professor of mine at school told us that he was extremely bitter about
the group of "traitors" (Noyce and those that left with him) who showed
no loyalty to him.

Terry Conklin will soon have his wish.
After the April issue, now in production, I am stepping down as Managing Editor.
The head of CNEPA might be making $125/year as head of a non-profit organization
but I certainly am not. No one on the Staff of AC takes ANY SALARY at all,
we are all volunteers, we donate our time & talents for free & non of us are
professionally involved in the writing/publishing field. In fact, since 1992
I've LOST a good $2,000 from my own pocket in the venture.

And, with public whippings like this, how many of you are now willing to
step forward to offer YOUR services to the community?

Come to think of it, Terry, what have YOU done for the community lately?

There are QUITE people out there who will disagree, rather strongly, with
Terry's criticisms of the Super Video modifications. Contrary to Terry's
assertions, the basic mod in the 800XL WAS tested, by MANY people, & this
is the first complaint I've heard. I received quite a few requests, many
from among members of my own usergroup who were using the mods, to please
present the material in AC. So I did. Sorry you didn't like it.

I suppose then, you will soon be offering us something BETTER ? C'mon, now,
don't keep all the goodies to yourself, out with it if you please.

If you want a professionally produced magazine published by a full-time
paid staff, go buy yourself a Mac or PC rag. The Atari 8-bit community
is not large enough to support a professionally published magazine any
more. People either have to accept what we among the comunity ourselves
produce, or take nothing at all. Terry obviously prefers nothing.

So, does Terry Conklin speak for everyone? Have I & 20-odd other people just
been wasting our time the past 2 years?

I do not hold my fellow AC Staffers to anywhere near as high a standard as
I would if they were salaried. I always remind myself, these guys are
DONATING their time & effort, I will take what they offer & be glad of it.
It is grossly unfair for anyone in the community to hold me, or any other
person who has contributed to the magazine, to the same standard as you
would a professional writer/publisher. I've simply done the best I could
with the resources available, I'm satisfied with has been accomplished, &
neither myself nor anyone else on the Staff has any apologies to make.

I always wondered what causes people to burn out. I don't wonder any more.

| Could you tell me a little about FlickerTerm 80. Like where you got
|it, for example. I looked on Genie and couldn't find it. Is it PD?
|Thanksbeforehand.

FT80 isn't available yet; it's still in its alpha stage. I've seen it,
and after using K65 for a while, FT80 is a breath of fresh air, I'll tell
you! It's actually READABLE, and emulates ANSI a well as vt100. So far,
FT80 doesn't support any file transfers, but I'm sure it will.

Clay Halliwell, the author of FlickerTerm80, does NOT want it released
this early in the game. How would it make him look as a programmer to
have an incomplete product made available?

BTW, it supports unenhanced 8bits (a la 400, 800) a well a the XL/XE...

|Hi,

|From time to time I see some one referring to FlickerTerm80.
|I wonder where I can get a copy to try out. Also, do you need
|the XEP80 for the 80 column mode? (if it has one). I
|currently use Bobterm v1.21 ... really good Telecomm software.

|Bill

FlickerTerm80 isn't available yet; it's still in alpha-testing. And no,
it doesn't require the XEP80. It uses a sort of "dual" GR0 40-column text
mode, alternating from one "half" to the other, which creates a certain
degree of flickering: hence the name. Because the "text" isn't bitmapped,
it's actual "text" characters, it is MUCH faster than either K65 or OmniCom.

BTW, it may be semantics, but I believe the latest version of BobTerm is
1.22--that's what I have, anyway. And yes, IMHO the BEST term package for
the 8bit... in 40-columns, anyway!

I think you are mixing two posts. I did talk about the small
size of some early systems, but I referred only to the AT&T
efforts; i.e., the 3B2/300 and the PC7300 (UNIX PC or 3B1).

> And speaking of small
>systems, now that chips have 64K of CPU cache on board you could

That's who I have never been able to figure out why someone
couldn't make an 8bit emulator card that could plug into
a slot in an MS-DOS machine and sell it for under $100.
I'm sure it would be possible but probably not economically
feasable.

Your flame is no more than the flame I gave myself after writing to you. But you seemed so eager to use your machine ... as if there was no way to do it RIGHT NOW ! I too have glanced with greedy eyes at all the monitors in thrift shops and wondered how I could connect them with my 65XEG. Someone drew me a crude diagram of how you must separate wires from the monitor and connect them to pins to the atari. It seems like it might be a simple cable to make. I sure would like to get beyond the crude screens of OmniCom. And the split screens of Kermit65 where you have to scroll back and forth are eye-splitting headaches. So I am waiting for a tutorial also complete with diagrams, pinouts, parts lists, and builders algorithm. :)

I find this pretty hard to believe, considering that there must be a
half-million AMIGA 500's out there sitting as dedicated controllers in
Video Toaster boxes and Video CD-I consoles. And speaking of dedicated
video, it has probably been dedicated MIDI users that have been keeping the
ATARI line alive. Most of the ATARI outlets that are left at present are
music stores. That is why I can't see ATARI dropping Falcon for long.
They have probably run out of development money and are trying to rebuild
their cash base. This is just a guess, as I don't normally read the
financial pages.

BP> No one on the Staff of AC takes ANY SALARY at all.

If ATARI CLASSICS is truly a "non-profit", perhaps it could be "rechristened" as a "glossy newsletter", rather than as a "magazine", and an outfit such as the Boston Computer Society (of Boston Massachusetts), J.A.C.S. -- Jersey Atari Computer Society (of New Jersey, USA), or Ol' Hackers Club of Long Island New York, could handle the distribution. The Boston Computer Society used to handle general mailings of up to thirty thousand members. I don't know if this is practicle, as I don't know if newsletters can take advertising, or whether computer clubs can perform mailings to non-members. (Hmm... I wonder if the BCS allows for "supporting" members along with "full" members. The BCS doesn't have much in the way of an ATARI 8-bit group, but I do know that they can handle the logistics of mass mailings. Hmm... I don't know if they would take such a request seriously or not; there is a lot of politics in the BCS and I haven't talked to a BCS member lately to find out what the relationship is between the board and the ATARI user group. The MAC user group had a Civil War last year, if that is any indication....) Is this a good idea to pursue such lines of inquiry? Does anyone know who the heads of the ATARI 8-bit sections are on the various online services? Hmm... I think the BCS is world addressible, both through FIDO (currently down in the NorthEast, reason unknown) and through UUCP InterNet.... Does anyone know what Dave Ahl is doing currently? Anyone wanting to write so badly as to put up with the abuse of ATARI EXPLORER, might like to put out "the good word" a few times a year "in his own voice", without having to schill for a corporate.... (Well, it's just a thought, anyway; I'd hate the forward momentum to be lost.)

Not sure who this may be directed to, but the Atari has composite output,
the cable you need would depend on what the monitor used.

The Atari has full color composite output, so the picture on a monochrome
monitor may not be as clear as it could be. I have an old monochrome
monitor sitting next to my desk, intended for eventual hook up to the
Atari, it has RCA jack input. I have not looked to see what I need to
hook it up, and cannot report on signal quality.

A color composite monitor would do better. The trouble is, for 80 column
output, you still have the same pixel resolution. It would sharpen the
pixels quite a bit (I assume) though. I may try this on my old Multiscan
which can be set for composite input sometime (who knows when though,
I've spent every evening this week working thru water problems from the
rain falling on frozen ground ... my well head in the cellar has turned into
a spring! ... and the septic system.... under a foot of water)

SO ... the answer is .. it depends on the specifics .. no general answer.

Source record: 102118

An open letter to Ben Poehland:

Ben,

Thanks for all the hard work you put into starting and keeping alive
Atari Classic. It is appreciated by many; even me although I never
subscribed to AC. To be fair, I never voted that I would support it
nor did I take a free copy.

I know how emotional the whole subject of Atari computers is. Of all the
computers I have used or am using, my Atari is the only one that I had
a real emotional attachment to. I have had (and still do) my first Atari
400 for over 10 years. Of course I added a lot of software and hardware
over the years. I still have most of it and can't seem to let go. Even
though it has been a couple of years since I used it in earnest for anything
but playing games, I can't get rid of it.

As far as AC goes, I didn't subscribe because I knew that I wouldn't get
any use out of it. I know that I will never go back to doing any serious
work with my 8bit. Over the years, though, I have supported many Atari
publications. I still have several years of Antic (with disk) and Analog.
I had about 4 or 5 years of Current Notes, but I found a good home for
them. I even had several issues of Softside (I'll bet a lot of the readers
of this group don't even know what I'm talking about with that one).
I even supported Aladdin for a year (for $75), and still have them. I
used to subscribe to Compute! when it supported the Atari and even have a
couple of issues of ROM magazine (but got them free at CES). I subscribed
to the official Atari magazines under various names for a couple of years
too. Today, I wouldn't subscribe to any of them either, which is why they
aren't around anymore. Other Atari users stopped supporting them also.

I think AC came too late. Atari users have grown acustom to not having
a printed magazine to call their own and don't want to shell an extra
$25 a year to get 6 issues. In my case, that decision had nothing to do
with the size, content or editorial staff of AC; it was strictly a decision
based on how much use I would get from a subscription.

So, personally, I mourn the passing of another herculean effort to keep
the Atari 8bit alive. In another 10 years, whenever I look at the boxes
of Atari 8bit stuff in my closet, I'll think of AC and have half a smile
in my heart but a tear in my eye.

Thanks Ben & staff...

The Atari never made any monitors for its 8-bits computers. You can hook up any composite monitor to it and it'll work. There's a cable which you need which plugs into the 5 (?) pin DIN jack and has a bunch of RCA connectors on the other end (which plugs into the monitor).

|> television programs and working with my Genesis).
|> (C) I *have* the monitor already.

Hmmmm....well I may have lost the train of thought on this thread, but
here's some basic "truths" of Atari and video:

Atari video is very close to the NTSC 525-line standard. Actually
it's more like 262 lines non-interlaced, but the horizontal
frequency is 15.75 kHz.

Atari output is composite; that is, color is encoded in the
chrominance portion of the video as a phase-modulated 3.58 MHz
color carrier. You won't be able to find RGB anywhere inside
your 8-bit. You would have to redesign GTIA (at least) to get
RGB out.

If you decoded RGB from your composite video output, you could
drive an RGB monitor. But that monitor had better be able to
accept the 15.75 kHz horizontal frequency. Most monitors made
for VGA and SVGA video won't go this slow, preferring to run
at 31 kHz and above. And even if you did do this decoding, it
would only look about as good as a composite monitor, which has
to do that type of decoding internally.

You can drive certain types of monitors (known as "split video",
"separate luma and chroma", Super VHS-compatible) with the luma
and chroma components on separate cables. The 800 came this way,
the 800XL and most others need some mods to split these signals
out. See the Dec '93 Atari Classics for the plans to do this.
The video quality you get with this method is about as good as
you can get, without a bunch of heroics.

Also check out, in the same issue, Bob Woolley's mods to provide
TTL video out of the Atari 8-bit and XEP-80. These mods let you
use an MDA or CGA monitor (which run close to 15.75 kHz).

Hope this clarifies everything :-)

Has anyone tried building and using the SIO2MIDI interface that's on the archive at umich? I have it breadboarded and am trying to use it with a stock 800 w/ 48k. The Test Output function works fine, the synth plays the scale ok. However, when I try to use any other functions like Record, or even Quit, the computer locks up tight. I have to reboot to recover. Has anyone made this work, esp. with an 800? Any hints would be appreciated. Thanks.

No, that's probably something different. You use the Ramdisk for the
ACTION language itself (right? Is my English good enough ;-).
What I meant is, that you can use the Ramdisk as a PART OF THE COMPILED
CODE OF A RUNNING QUICKPROGRAM :-) E.g. you can put subroutines of your
program into the ramdisk.

My father has an Atari 1200XL with a 1050 drive which he uses for his geneology research. I am looking into finding out how to convert his data files (most of them are in AtariWriter format) to IBM format.

I remembered buying some U.S. Doubler chips from a friend way way back so I had my Dad dig them out. The instructions with the chips are pretty skimpy. Does anyone have some good docs on installing them or some first hand knowledge?

Would it be better to try to find some used DD drive like an Indus GT or XF551?

Its been so long my memory is pretty fuzzy.

Thanks for any help,
Mark

For more information about Commodore's recent financial crisis
I would suggest reading COMP.SYS.AMIGA.ADVOCACY.
It does look as if they are in very dire straits. As far as
Atari goes, no their computers have not allowed them to stay
financially healthy. Their Jaguar, though, has been getting
great press and is nearing national distribution. Atari lost
money ($22 million?) in the last quarter, but have gotten a
cash infusion from Time-Warner who has purchased a million or
so shares at an above market price ($8.50/share). So it looks
as if Atari has a chance (and they do plan to continue making
computers supposedly). Commodore looks as if they very well
might not survive.

|> Argh!!! When was Flickerterm 80 released and where is it available? Is it on
|> the umich archive somewhere?

Hmmm...three requests in a row (Robert Stout and Bill Somrak included) for FlickerTerm 80. Clay Halliwell (E.HALLIWELL@genie.geis.com) is developing this. About six of us have beta copies of it. It has not been released anywhere. It does go pretty decent 80 column emulation on a stock Atari (without XEP-80), but with a fair amount of flicker. Clay is adding ANSI and VT100 emulation (so good so far). If Clay posts the PD or shareware release of it on GEnie, I'll pass it on to umich or interested parties.

FlickerTerm sounds OK but I hope it includes at least Xmodem CRC.
Releasing incomplete software is permissable if it is clearly labeled
as beta. But then I have to warn that no file transfers will make
many pass it by. How about baud rates?

1449. Adaptec ACB-4000

Newsgroup: comp.sys.atari.8bit
Date: 1994-03-31 22:32:07 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9403312215.AA01651@phinet.smithkline.com>
Source record: 102130

In response to Andrew Heller's question about the Adaptec 4000A, yes, this HD controller was highly recommended by both ICD & CSS. I saw them in the CSS catalog for $89 & wish I'd bought mine there. I got a couple of them from some surplus place in California who nailed me $120 apiece for them.

If you can get an Adaptec 4000A (at ANY price), grab it! They're getting really rare. One nice thing, Adaptec is still in business & will send you complete docs on the card. I can't recall if the docs were free, I think they were. BTW for folks who don't know what this beastie is, the Adaptec 4000A is a SCSI-to-MFM hard drive controller card to let you use old MFM-style IBM hard drive mechs with a Black Box or MIO. Bob Puff once told me it was better to use a setup employing a controller card plus MFM drive rather than an imbedded SCSI drive. Embedded SCSI's have caused major headaches for both ICD & CSS, since the implementation of the SCSI isn't always standard. I've had no problem so far with Seagate embedded SCSI's or the SyQuest SCSI, but I did have a problem with 40-meg Quantum SCSI. Using a controller card + MFM drive is a pain to set up but seems to provide the most trouble-free path to using a hard drive with the 8-bit.

From: Krishna@tiac.net
Message-ID: <2nful8$str@sundog.tiac.net>
Source record: 102134

I had serious resrvations about AC due to one major fact: Unicorn publications.

Now, I knew that AC had nothing to do with AIM, but when I saw the output, it seemed like one of the AC staffers who may own a clone or ST or MAC could have whipped up the mag with Pagestream or Calamus or something and just set it to Copy Cop for less than what Unicorn charged AC, and with none of the binding contracts involved in a serious business transaction. The actual layout would have been free (done by the guy with the ST) and thus the only cost would have been the copying and mailing. THAT is what I call self reliance. Even with 100 subscribers they would have been able to continue.

I suppose that definition seems more like a NEWSLETTER than a MAGAZINE but calling AC a true magazine is a stretch due to its brief nature.

This turned off many people I guess. It may have even been possible to do it all off of an 8-bit DTP package. It would have been very gruelling that way, and it would have been blockier, but it would have been possible and in-keeping with the spirit.

The reality is, though, that 99% of what any 8-bitter wants to know is available immediately via these very telecommunication networks. Rarely if ever did I see anything NEW in the pages of AC. The video mod issue was the first instance of something totally new in AC. To people who don't have modems, AC would have been great, but it is a catch-22 since they don't even KNOW about AC most likely. Since AC was never going to be on a newstand, it was never going to find isolated 8-bitters who aren't as priveledged as we are in being able to get up to the minute news all the time.

If through some miracle the first issue of AC was on every newstand I think we would have pulled in 1000s of subscribers, because there must be 10-100 times the number of die hards using 8-bits in some capacity but are unaware of any remaining support. Therein lies the rub!

However, it should be noted that for a 15 year old computer, the fact that AC existed at all is an acheivement, and it was only a matter of TIME when this was going to happen, if not this year, then next year. The userbase will invariably decline I'm afraid to admit.

* *

8-bitters must live for the moment! Realize that the demise of AC is not going to be the only cross we have to bear in the future. Sooner or later others will fall as Bellcom recently did. Who shall it be next? How will we feel when B&C or BEST close their doors?

Will we finally admit the end when Bob Puff himself is forced to call it quits? Haven't you all thought about the possibility? CSS in particular must be solvent by only the most careful and constant attention of Bob, and I must only assume that he at best makes a meager income if anything off of CSS. There was a scare that Bob may not be able to produce the R:P: interface as planned despite sending out the mailing even. People must understand that the act of them subscribing or buying a product from CSS or FTE is probably the only thing keeping them going. In order to stay afloat every die hard has to "contribute". When AC started it was a matter of principle that I subscribe. It was a show of support. No matter how I felt about the bi-monthly and brief nature of the text, it would have been a SIN not to support it. Because I recognized the economic realities which has led to these compromises. Others are simply DENYING these realities and still think the 8-bit is cruising along comfortably the way it was in the mid '80s. Nothing could be farther from the truth.

My advisce to those who call yourselves die-hards, buy now and not later. You may not get a second chance.

I am concerned about FTE. Mike is going into this project with at least an optimistic exterior. I hope he isn't broken the way Ben was by a series of disappointing responses by the "userbase" <-- not my use of quotation marks. Any comfort we may have in FTE coming from the ashes of ICD so unexpectedly should be reconsidered. ANY sense of complacency in the 8-bit world is FALSE.

The bottom line is to support everyone who is still doing something for us, from shareware programmers like Clay Halliwell, Jeff Potter, Puff, R.R., Larry Richardson, Tom Hunt, etc, as well as the remaining developers and used dealers. A little support from EVERYONE goes a long way.

I know when it comes to shareware programmers, it only takes a few good words and a few checks to make the whole project worthwile. I don't think Tom Hunt realistically expects to make serious money from his programming; what they do get is the satisfaction in knowing they have contributed to the userbase and they want RECOGNITION for this in some way, even if it is only kind words.

If I worked my ass off on a program I wouldn't want the userbase to just use it like crazy and not even thank me verbally...

: "If you're in the boat, rock it to hell."

I have a 1400XL that works. The only thing that distinguishes itself in its present functionality is the voice chip. The design of this particular prototype did not have a fully functional PBI. The port is there but not even BOb Puff could get it to work. Also, the modem card has been removed and may not be functional, which is no big loss since it is 300 baud and uses a hardcoded T: handler which not much software will even recognize.

It took me a great deal of money to make this thing work. It was a soap opera of getting a power supply made for it, fixing it after I tried on my own to hook a supply to it, slight damage in shipping, and getting it to work with the MUX OS.

The initial investment was $175 for the board. I mus have put an additional $100 into it at least, for the 1200XL case I put it into and what not. I'm using it right now.

I like it, but I am rather hesitant to try a memory upgrade on it,and if I do not, its functionality for a hard core user like me will be limited.

If you REALLY want it, then make me an offer. The V: handler is fun to work with. The V: handler seems to load from the speech chip itself, and bumps MEMLO up by 512 bytes. This has not created any compatibilities with software so far, at least using SpartaDOS 3.2z.

:
: |Bill
:
: FlickerTerm80 isn't available yet; it's still in alpha-testing. And no,
: it doesn't require the XEP80. It uses a sort of "dual" GR0 40-column text
: mode, alternating from one "half" to the other, which creates a certain
: degree of flickering: hence the name. Because the "text" isn't bitmapped,
: it's actual "text" characters, it is MUCH faster than either K65 or OmniCom.
:
:
:
Back in my Atari 8bit days, I used a public domain Term80, which utilized a
custom font containing two characters for each screen character. By combining
the right pairs, the 40 character screen was effectively an 80 character
screen. As with any 80 character display, be it generated in hardware or
software, a monochrome monitor was very readable, whereas a TV or color
monitor was not. There was NO flickering.

The program was great at giving 80 column access, but its file transfer
capability was rather weak.

I didn't use BobTerm very much. Not because it isn't an excellent piece of
software, but because I was too cheap to register it when I already owned
Keith Ledbetter's SX Express!. (My apologies to Mr. Puff- but at least I
was legit).

: I know an Alchemist who could make good use of such info....

: (Note: this is the 1400XL, not the 1450XLD.)

: - Ben Poehland

No case, right? Well if you want to follow my lead, we can discuss this
in email as I've been through the same path you are headed into. Step
one is to get a power supply, and Bob Puff knows the pinout--it is NOT
the same as the XL/XE. Putting in an incorrect pinout can burn your
board out as it did with mine.

I have a text file on the V: handler but it is not totally complete.
What it doesn't tell you is whether it is possible to reach the Votrax
SC-01 via ML. The V: handler itself will not let you change pitch, but
the SC-01 DOES have this ability, it is the same chip that sang in the
Alien Voice Box and got a write up in Creative Computing.

I also have an upgrade detailing how to upgrade the 1400 to 320K ala the
Peterson 65XE > 320K upgrade.

If you want more details, email me. Together maybe we can help eachother
out, i.e. I have been too squeemish to try the memory upgrade but I'm
sure you could handle it.

I've always wondered why it was so important to have a "true" magazine. What's important is to have good writing, good information, and editorial sense beyond that of most cheez-o-matic diskzines. In addition to AC, I also subscrive to Tim Duarte's _The 2600 Connection_. Quite honestly, I get about the same enjoyment from both. T2C is only a photocopied newsletter, but there is an air of professionalism about it (anyone who has read a variety of video game fanzines should really appreciate this).

Over in Apple II land there is a publication called "Shareware Solutions II." Again, it is the child of one dedicated person, but it holds the community together quite well. For what it's worth, I also think that the small-timey newsletter feel breaks down a lot of barriers that seem to crop up when a shift is made to "real" publishing.

So what's wrong with a 12-20 page, desktop published, inkjet printed, photocopied newsletter to replace AC as we know it? Honestly, I think even a straight text format with pasted-up figures would be fine. A lot cheaper to produce, too.

Message-ID: <9404010259.AA21249@theclub.mi.org>
Source record: 102140

> Terry Conklin will soon have his wish. After the April issue, now in
> production, I am stepping down as Managing Editor.

Thanks, but don't claim I said something I didn't. No one asked you to
quit (at least I didn't.) I asked you to do your job professionally.

> And, with public whippings like this, how many of you are now willing to
> step forward to offer YOUR services to the community?

If someone volunteers to do a job, and does it badly enough, it's better not
to have the help. (Parents with small children should relate)
This is not to say your job was that bad, but to point out merely
volunteering does not absolve you of a responsiblity to make good use
of the community's funds.

> Come to think of it, Terry, what have YOU done for the community lately?

I continue to operate The Club & Club II, some of the largest Atari 8-bit
supporting BBSes around - free, of course, as I've run them for the last
14 & 11 years, respectively. (Some 200,000+ hours of service in two different
area codes and 200,000+ calls handled) I realize that the 95% of the Atari
population that isn't on the net doesn't count for much, but I like to make
sure that they have access to Atari 8-bit archives, news, discussion and
tech support all the same.

Regardless, other peoples' actions aren't excuse or measure for your own.

> ... The Atari 8-bit community
> is not large enough to support a professionally published magazine any
> more. People either have to accept what we among the comunity ourselves
> produce, or take nothing at all. Terry obviously prefers nothing.

Well, if it's the Self Gratification Letter for $25 or nothing, yes,
nothing is preferable. Mid-Michigan Atari Magazine never had the problems
AC had with professionalism, and it was an all-volunteer effort. And
Atari Classics would still have my subscription if it didn't have your
articles. Hell it was almost worth the price just for the ads.

> I've simply done the best I could with the resources available, I'm
> satisfied with has been accomplished, & neither myself nor anyone else on
> the Staff has any apologies to make.

I think you have. You've harped on the net a dozen times about the Evil
Non-Subscribers, declaring them traitors, scum, and worse, because they,
having seen what you were really delivering, weren't interested. Really
pretty damm rude, if one's honest about it.

Specifics of AC and begging for martyrdom are just distractions from the real point. You've made all sorts of wild claims and accusations of OTHER PEOPLE concerning Atari Classics loss of subscribers. My POST was a disgusted response to these POSTS.

AC's problems start with -=> AC <=-. You've blamed everyone and the stars for AC's problems except AC itself, and certainly not yourself. Lets get one _fact_ straight. ATARI CLASSICS LOST MY SUBSCRIPTION BECAUSE OF YOUR ACTIONS.

Likewise, I appreciate your effort. It's a lot of work. (Been there myself) But if you work that hard and that's what you've got to show for it, then tough rocks, it's not enough. Sorry, but the means doesn't justify the end, either.

1460. Re: What Good Is An Atari 8-Bit?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-01 04:05:38 UTC
From: Lonnie McClure <lmcclure@delphi.com>
Message-ID: <p2zPRBS.lmcclure@delphi.com>
Source record: 102141

"The x86 are more like the 8080. It is a terrible shame
IBM chose it during that critical period - this decision
has probably cost the computer industry more in programmer
hours that any other decision in the history of computing.
If those designers had had any idea how far-reaching their
decision was to be, they undoubtedly would have waited the
several months for the 68000."

As to waiting for the 68000, as I recall, the 68000 was available,
but would have needed a 16-bit bus. Given that one of the reasons
IBM chose the 8088 over the faster 8086 was to save costs by going
with an 8-bit bus, I think this is a moot point, however. It is too
bad the 68008 would not come until later.

However, in looking at the September 1990 issue of BYTE, at the
article "The Creation of the IBM PC" by one of the people who worked
on it, there were other reasons, as well. Basically, first, it had to be
available then, in quantity. Second, it had to address more than 64K
(ruling out the 6502, Z-80, and 6809, although the 64K segment limit
of the 8088 did not seem to bother them too much). Third, it had to
be "familiar" technology, and have a bevy of available support chips,
and last, there had to be an OS and operations software available for
it (not a strong point of the 8088 at that time).

Frankly, if it had not been for the "breaking the 64K address limit",
three big 8-bit chips would have been the likely candidate. The OS,
and likely, applications (from a business perspective) likely fell
to the Z-80, due to C/PM. All of the 6502's used proprietary OS's, and
I don't even know of OS-9 (for the 6809) had been written yet. Any of
these chips should have been "familiar" enough and had no shortage of
support chips (especially, again, the Z80). Certainly availability in
large quantities should not have been a problem, either.

All things, considered, if the 808x had not been around (or if they
would have thought 64K was enough address space), we likely would have
ended up with a Z-80 based IBM PC...yet another branch off of the
8080/8085 lineage! despite the 8088's 64K segments).

Some interesting trivia: According to the article in BYTE, IBM estimated
total sales of 250,000 units over a 5 year period. It goes on to state
that there were single months when that many were sold.

Oh, but for a peek into that alternate universe where IBM *did* use
the 68000 instead....

Source record: 102142

In a message dated 3-30-94, Glenn Saunders said:

"I too am curious about the development of the 400/800.
To anyone with half a brain the 400/800 was graphically
more advanced than the Apple][. But in a way, this
caused a reputation of the 8-bits as ONLY "game machines"
in a computer box, "

Of course, few either remember or know that one of Woz's main goals
in creating the Apple was a machine that could play Breakout (in color).
Another item which helped Apple foster more of a "business" reputation
were when an 80-column card standard was established for the Apple II.

With each new machine, Atari passed over the opportunity to make
80-column capability either standard, or a easy, company-endorsed
option, and with each failure to take advantage of a new design to
do so, the difference it could have made became smaller. By the time
Atari finally coughed up the comparatively kludgy XEP-80, the 8-bits
had just about run the course of their mass market life.

1462. Re: Multi-Tasking on the 8-bit Copy

Source record: 102143

In a message dated 3-26-94, Glenn Saunders said:

"...but in my mind the only way to REALLY do a flexible
multitasker is to have an alternate 64K bank which is
fully addressable and NOT in 16K chunks which you can
alternate to and from, and each additional app you run
would require yet another 64K bank."

But if you change all of the RAM memory, you will end up with the stack and page zero locations for one program in the RAM, and information based on another 'set' of RAM stored in the 6502's registers and program counter, unless you reset the CPU and hold it in that condition during the switch. Even then, without some code to 'remind' the CPU of what it was last doing in that section (which could interfere with running some programs as surely as an area of common RAM), it would be like starting over again each time you switched.

Here's a wacky idea...since customized 6502 in the XL series and later incorporates a halt line, why not have a 6502 for each bank, and put it in halt mode (freezing its register status) while that bank was not in use? <grin>

1463. Re: Taking the Plunge?!?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-01 04:08:52 UTC

In a message dated 3-30-94, Roger Cole said:

"It seems Commodore is on the brink of bankruptcy after
something like 7 straight quarterly losses.

Has the Jaguar and the ST line been able to keep Atari
healthy, or could this be the handwriting on the wall?"

One big difference between the two companies is that Commodore has long carried a heavy debt-load, while Atari has not. (In fact, I believe Atari currently has no LONG-term debt).

According to the last quarterly report, Commodore had *negative* net worth. In other words, the company is actually worse than worthless. <grin>

Seriously, Commodore is in serious hurt, and is having problems getting the funds to build what they can sell, which does not help their situation. Whether they can continue depends on if they improve their situation, and how many of their creditors think they can get more money back by letting them continue as opposed to forcing them into reoranization or liquidation.

1466. Re: Not really Atari, but ...

> The XEGS was marketed as a game machine so Atari had pretty much
>given up in trying to prove that the 8-bit was a true computer.

Depressingly, Atari themselves never considered the Atari8 anything more than a game machine. Software developers of the time, who had written business packages for the Apple II had approached Atari in search of developer info and support. Atari flat refused them, and even went so far as to tell them, "We don't want your software on our machine. This is a game machine." From the beginning, Atari didn't even have a clue. :-(

Great lets put them on an ftp site. Does anyone have a site that we can
lend. I have some antic disk but not all and currently no way to upload
then until I get a 850 which I should get soon. Lets orginize them like
this.

\05.89\s1
\05.89\s2
\06.89\s1
\06.89\s2
Or does someone have a better idea.
Or maybe we should put them in arc format however I'm not quite shore
how you would go about making a disk if you only have one disk drive
form the arc format. Is there a way....

So who is willing to lend some disk space for this. I could do my share
and upload the disks I have but I would need some help here in fillling
in the others I'm sure that between us all we can get the complete disk
set uploaded.

>
>Boy, did I have some cool games. Even if I do manage to buy another Atari
>8-bit system, I'll probably never find another copy of M.U.L.E. (sigh)...
>

My latest American Techna-Vision catalog lists M.U.L.E. (stock number
SX3433 for $29.95). It does say 'Limited quantities' but it may be
worth a call. Their toll-free order number is (800) 551-9995.

>SC-01 via ML. The V: handler itself will not let you change pitch, but
>the SC-01 DOES have this ability, it is the same chip that sang in the
>Alien Voice Box and got a write up in Creative Computing.
>

Do you have adequate documentation on the SC-01 chip? I have the data
sheet for it, and an article and construction docs (with software printouts
for the chip used .. can't rmember if it was a 6800, 6520, or 6805 or what)
from the Steve Ciricia speech synthesizer project, as well as reference
articles on speech to phoneme conversion (dated .. this was like 10 years
ago). The data sheet, at least, may be useful to fill in any gaps in your
documentation.

In article <p2zPRBS.lmcclure@delphi.com> Lonnie McClure <lmcclure@delphi.com> writes:
>
>However, in looking at the September 1990 issue of BYTE, at the
>article "The Creation of the IBM PC" by one of the people who worked
>on it, there were other reasons, as well. Basically, first, it had to be
>available then, in quantity. Second, it had to address more than 64K
>(ruling out the 6502, Z-80, and 6809, although the 64K segment limit
>of the 8088 did not seem to bother them too much). Third, it had to
>be "familiar" technology, and have a bevy of available support chips,
>and last, there had to be an OS and operations software available for
>it (not a strong point of the 8088 at that time).

I think the reason the 64K segment limit did not bother them
at the time is that no one visualized single program modules
larger than that size. I believe that the very popular PDP
series of MINI computers had a 16K segment limit, though that
might be 16 bit words and not 8 bit bytes (anyone know the
PDPs?) And programs were written in overlays to be loaded from
the disk as needed, cause memory was so expensive.

The competition was using the Z-80 (as far as sales go) and paging
extra memory in and out as needed to get past the 64K limit, so built
in segmentation was probably seen as a better solution (though as
we all know and love to hate, not as good as a flat memory map).

>
>Frankly, if it had not been for the "breaking the 64K address limit",
>three big 8-bit chips would have been the likely candidate. The OS,
>and likely, applications (from a business perspective) likely fell
>to the Z-80, due to C/PM. All of the 6502's used proprietary OS's, and
>I don't even know of OS-9 (for the 6809) had been written yet. Any of
>these chips should have been "familiar" enough and had no shortage of
>support chips (especially, again, the Z80). Certainly availability in
>large quantities should not have been a problem, either.

My 1 MHz 6809 system (now bear in mind how software dependent this
all is) seems to me to be faster than our AT&T 6300s (about 1.9 times
as fast as the plain XT), and hence probably more than twice as fast
as the XT (at least for the Basic programs I have run on both).
And at the time the XT was developed, 2 mHz 6809s were selling
nicely ... which would have been 4 times as fast. The standard
Z80s at the time were 4 MHz, and I believe this was somewhat faster
than the XT (I have no comparasions though). Shortly after the
XT introduction, Z80s started moving to 6 MHz.

As an addition to these performance concerns, the 68008 was somewhat slower than the 6809, sort of the same way a 386SX is slower than a 286 running at the same clock speed.

1474. Atari 8-Bit Computers: Frequently Asked Questions

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-01 16:56:58 UTC
From: aa700@cleveland.Freenet.Edu
Message-ID: <2nhjoq$kdr@usenet.INS.CWRU.Edu>
Source record: 102305

```
Atari Archive: 8bit/faq.txt

Welcome to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group!

Atari 8-Bit Computers

Frequently Asked Questions List

Revised 30-Mar-94

Additions/suggestions/comments/corrections having to do with this
FAQ List are welcomed by its creator and maintainer, Michael Current:
Internet: mcurrent@carleton.edu
UUCP: ...!umn-cs!ccnfld!mcurrent
Cleveland Free-Net: aa700

The Atari 8-Bit Computers FAQ List is posted on the 1st of the month to the
comp.sys.atari.8bit/Info-Atari8 Digest discussion group. A fairly
recent copy is available on the Atari Archive (see below) as the file
8bit/faq.txt, but the most recent copy may always be requested from
mcurrent@carleton.edu.

What is this FAQ List for?
The Atari 8-Bit Computers FAQ List was created to provide answers to many
commonly asked questions found in the comp.sys.atari.8bit/Info-Atari8 Digest
discussion group. At this time the FAQ List is heavily geared toward
describing the various resources for the 8-bit Atari user available, with
relatively little information on the Atari itself.
This is not an "official" FAQ List in that it is not cross-posted to the
moderated newsgroups news.answers and comp.answers. (There's no particular
reason for this, I just haven't taken the time to figure out the process yet.)

What is comp.sys.atari.8bit?
comp.sys.atari.8bit is the unmoderated newsgroup serving as the Usenet
side of this discussion group. All postings to comp.sys.atari.8bit
automatically appear in the Internet's Info-Atari8 Digest.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid on
comp.sys.atari.8bit.

Other Atari-related newsgroups:
comp.binaries.atari.st (ST/TT/Falcon software, object code)
comp.sources.atari.st (ST/TT/Falcon software, source code)
comp.sys.atari.advocacy (pros and cons of Atari computers)
comp.sys.atari.st (ST/TT/Falcon)
comp.sys.atari.st.tech (ST/TT/Falcon technical)
comp.sys.palmtops (includes Portfolio)
```

rec.games.video.arcade (includes products by Atari Games)
rec.games.video.atari (Lynx, Jaguar)
rec.games.video.classic (includes 2600, 5200, 7800)

What is the Info-Atari8 Digest?
The Info-Atari8 Digest is the unmoderated mail-list serving as the Internet side of this discussion group. All contributions to the Info-Atari8 Digest automatically appear on Usenet's comp.sys.atari.8bit. The Digest is maintained by Mike Jewison <mjewison@nereid.sal.ists.ca> and Mike Todd <snyder10@convex1.TCS.Tulane.EDU>.

To SUBSCRIBE or UNSUBSCRIBE to the Info-Atari8 Digest, send e-mail to info-atari8-request@naucse.cse.nau.edu.
To CONTRIBUTE to the Info-Atari8 Digest, send your posting to comp-sys-atari-8bit@cs.utexas.edu. Postings sent here automatically appear on Usenet's comp.sys.atari.8bit.
Note that any posting sent to info-atari8@naucse.cse.nau.edu will NOT be cross-posted to the Usenet side. The maintainers are presently working to correct this.

Discussion related to the 8-bit Atari 400/800/XL/XE computers is valid in the Info-Atari8 Digest.

Other Atari-related mail-lists:
The Info-Atari16 Digest (ST/TT/Falcon). Send e-mail to info-atari16-request@naucse.cse.nau.edu.

What is the Atari Archive?
The Atari Archive is that section of the University of Michigan/Merit Software Archives that holds a huge number of files covering all Atari products, including the 8-bit computers. Our 8-bit Atari Archivist is Jody Lenn, lenn@atari.archive.umich.edu; the Atari Archive as a whole is maintained by Jeff Weiner, weiner@atari.archive.umich.edu.

How do I DOWNLOAD files from the Atari Archive?
In one of four ways:
1. FTP (Try the site nearest you first.)

a) FTP to atari.archive.umich.edu (141.211.120.11) <--United States
User: anonymous
Password: [your e-mail address]
cd atari/8bit

b) FTP to wuarchive.wustl.edu (128.252.135.4) <--United States
User: anonymous
Password: [your e-mail address]
cd mirrors/archive.umich.edu/atari/8bit

c) FTP to src.doc.ic.ac.uk (146.169.2.10) <--Great Britain
User: anonymous
Password: [your e-mail address]
cd computing/systems/atari/umich/8bit

d) FTP to archie.au (139.130.4.6) <--Australia
User: anonymous
Password: [your e-mail address]
cd alex/edu/umich/archive/atari/atari/8bit

e) FTP to info2.rus.uni-stuttgart.de (129.69.8.13) <--Germany
User: anonymous
Password: [your e-mail address]
cd /afs/umich.edu/group/itd/archive/atari/8bit

f) FTP to nic.switch.ch (130.59.1.40) <--Switzerland
User: anonymous
Password: [your e-mail address]
cd mirror/atari/8bit

g) FTP to mirror.archive.umich.edu
This address takes you to a "randomly chosen" University of Michigan/Merit Software Archives mirror site, but there's no guarantee the site you're taken to mirrors the Atari directories.

Remember to set file type to BINARY when downloading non-text files (.arc, .com, .dcm, etc.) by FTP.

2. BART - Brode's Archive Retrieval Thang - the Archive's e-mail file server
To learn about using BART to access the Archive, send e-mail to: atari@atari.archive.umich.edu. The subject of the message doesn't matter, but let the body of your message be:

help
send 8bit/0index

If you receive nothing within a day (it should take just a few minutes), try including a line of this form:

path [your e-mail address]

BART automatically uuencodes binary files (so they may be mailed over the Internet) and splits up large files into parts of about 30K or less.

3. Gopher
The Atari Archive can be accessed in Gopher. If your system has a Gopher client, try the command "gopher gopher.archive.merit.net 70" to connect directly to the Merit Gopher server, and choose Merit Software Archives.

4. AFS
If your system has AFS capability, this is the easiest way to access the Archive. Just cd /afs/umich.edu/group/itd/archive/atari/8bit

How do I UPLOAD files to the Atari Archive?
In one of three ways:
1. FTP
FTP to atari.archive.umich.edu (141.211.120.11)
User: anonymous
Password: [your e-mail address]
cd atari/8bit/New

(No uploads may be made to the Archive's mirror sites.)

Remember to set file type to BINARY when uploading non-text files
(.arc, .com, .dcm, etc.) by FTP. Also, please upload a short .text file
describing what your upload is, so our 8-Bit Archivists will be sure to place
it in an appropriate permanent directory.

Note that the atari/8bit/New directory is "write-only."

2. E-mail
This is a bit slower, but is still very effective.
Simply uuencode the file, (please split it into parts of 60 K or less)
and mail the result to lenn@atari.archive.umich.edu. Please name
the parts in the subject line. This is really helpful as the parts
usually don't arrive in the proper sequence. Also, please include a
message labeled "file transmission," containing a short description of
the file, etc. Shar files are also acceptable, but uuencoded is preferred.

3. AFS
If your system has AFS capability, this is the easiest way to upload to
the Archive. Just cp the file into
/afs/umich.edu/group/itd/archive/atari/8bit/New

Are there any other 8-bit Atari FTP sites?
Here's another, maintained by Adam Bryant, adb@albert.bu.edu:
FTP to cs.bu.edu (128.197.2.2)
User: anonymous
Password: [your e-mail address]
cd PC/ATARI

Are there any alternatives to BART?
There are two general-purpose FTP mail-servers. These may be used to
retrieve any files available from anonymous FTP sites on the Internet,
including atari.archive.umich.edu.
1) ftpmail@decwrl.dec.com
For information, send a mail message to the above address where the body of
your message says:
help
quit
2) bitftp@pucc.princeton.edu
For information, send a mail message to the above address where the body of
your message says:
help

What is the Cleveland Free-Net Atari SIG?
The Cleveland Free-Net is like a huge public bulletin board system, and
it is the hub system of the NPTN, the National Public Telecomputing Network.
Anyone can access the Cleveland Free-Net via modem at (216) 368-3888. Those
persons with full Internet access can TELNET (this does not mean FTP) to
freenet-in-{a,b,c}.cwru.edu (129.22.8.32, 129.22.8.51). Applications for
free accounts are handled online, or you may browse the system as a visitor.
Once logged-in, type "go atari" to reach the Atari SIG. Those who add their
names to the Atari SIG user directories are automatically members of the

official Atari user group C.A.I.N. - Central Atari Information Network.
Send correspondence and press releases to xx004@cleveland.freenet.edu.
The Atari SIG's 8-Bit Computers Support Area is maintained by Michael Current,
aa700@cleveland.freenet.edu, the 8-Bit Technical Forum is maintained by Craig
Lisowski, aa853@cleveland.freenet.edu, and the Atari SIG Manager is Len Stys,
aa399@cleveland.freenet.edu.

What other Free-Net Atari SIGs are there?
[to be written]

What product developers or vendors support the 8-bit Atari?
There are two files available:
1) "All Known World-Wide 8-Bit Atari Vendors and Developers" is part two of the Atari 8-Bit Computers FAQ List, and is posted to the comp.sys.atari.8bit/Info-Atari8 Digest discussion group on or about the 15th of the month. There's also usually a fairly recent copy available on the Atari Archive as the file 8bit/faq2.txt, or you may contact the maintainer at mcurrent@carleton.edu.

2) "The Official **AC** Vendor List" is maintained by Atari Classics magazine's Advertising Editor, Bob Scholar, r.scholar@genie.geis.com. This list focuses on North America, but all sources listed have been personally confirmed by the AC staff.

What's this UUEncoding stuff (.uu, .uue files) all about?
UUEncode/UUdecode is a UNIX utility that will convert a binary file into 100% printable ASCII characters, so that the file may be posted or e-mailed anywhere a text message can go. The 8-bit Atari is perfectly capable of UUEncoding/UUdecoding as well. On the Atari Archive:

Uudecode 1.2a by John Sangster - very functional. Archive filenames:
8bit/Archivers/uudecode.bas - just ENTER this into Atari BASIC
8bit/Archivers/uudecode.doc - the User Manual

Yet Another UU-coder by ?John Dunning? - both decoding/encoding. Filename:
8bit/Archivers/yau.arc - contains both yau.com and yaue.com.

Uudecode.com, Uuencode.com by ??? - "newer, cleaner, easier to use." Filename:
8bit/Utilities/uue.arc - contains uudecode.com, uuencode.com.

Dumas UU-coder by John Dunning - should work w/BART-style split files. Fname:
8bit/Cc65/dumasuu.arc - contains uud.com, uue.com, CC65 sources.

What is an .arc file?
A file with the extender .arc has been archived in a standard manner that
is common in the MS-DOS world. This is done to make the file shorter,
so it takes up less space on your disk and it takes less time to transfer
between computers. The Atari Archive contains several 8-bit Atari archivers
fully compatible with this standard, including:

Super Un-Arc 2.3, Super Arc 2.0 by Bob Puff - highly recommended. Filenames:
8bit/Archivers/superarc.arc - both Super Un-Arc and Super Arc
8bit/Archivers/suprarc2.arc - just Super Arc
8bit/Archivers/supunarc.com - an un-arc'd copy of Super Un-Arc
8bit/Archivers/supunarc.uue - uuencoded copy of supunarc.com

Okay, how about a .dcm file?
A .dcm file is a format unique to the 8-bit Atari which is used to convert
entire disk images into files. To work with .dcm files you'll need:

Disk Communicator 3.2 by Bob Puff. Archive Filenames:
8bit/dskcom32.arc
8bit/Archivers/diskcomm.arc

Can I read/write 8-bit Atari disks on an IBM-PC?
There are several programs on the atari.archive of this variety. Note
that most require a DOS and disk drive on the Atari end capable of the SS/DD
180K format (SpartaDOS, MYDOS, etc.; XF551, Indus GT, etc.). The programs are:

ATARIO by Dave Brandman w/ Kevin White - Reads SS/DD 180K Atari disks.
8bit/Diskutils/atario21.arc

Mule by Rick Cortese - Reads/Writes SS/ED 128K Atari disks. Very limited.
8bit/Diskutils/mule.arc - includes Atari Mule; Action!, Turbo C sources
8bit/Diskutils/mule.exe - IBM Mule
8bit/Diskutils/mule.txt - descriptive blurb

SpartaRead by Oscar Fowler - Reads SS/DD 180K SpartaDOS disks. Filename:
8bit/Diskutils/sr.arc

UTIL by Charles Marslett - Reads/Writes SS/DD 180K Atari disks. Quite popular.
8bit/Diskutils/dskutil.arc
(Older versions are contained in pcxfer.arc, util.arc, and ataridsk.arc)

What's the best DOS for the Atari?
This is a matter of opinion, but general consensus is that all 8-bit Atari users should treat themselves to either MYDOS or SpartaDOS to appreciate the power of the system. MYDOS is modelled after Atari DOS 2.0S/2.5, but provides subdirectory and hard-drive support. SpartaDOS is a completely different command-line DOS modelled after MS-DOS, though it is perfectly capable of reading all Atari DOS and MYDOS disks. SpartaDOS 3.2D is disk-based; SpartaDOS X is cartridge-based and includes many additional features. While it's hard to argue that SpartaDOS X is not the most advanced DOS available, it is a commercial product that is no longer manufactured. MYDOS, on the other hand, is a shareware product that continues to be improved upon.
It is recommended that all 8-bit Atari users own at least DOS 2.5 for complete compatibility with existing software, and then choose either SpartaDOS or MYDOS as they see fit. MYDOS is available at the atari.archive.

What are the best telecommunications programs available for the 8-bit Atari?
Here are some of the more popular PD/shareware terminal programs available on the Atari Archive:

BobTerm by Bob Puff
Emulates: VT52
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: XMODEM, YMODEM, FMODEM
Autodial: Yes
Archive filename: 8bit/Telecomm/bterm12.arc

Kermit-65 by John Dunning
Emulates: VT100
Text: 40 columns in gr.0; 80 col. in gr.8; 80 col. w/ XEP80 (sort of)
File Xfer: Kermit
Autodial: No
Archive filenames:
8bit/Telecomm/k65v37.arc - the latest version
8bit/Telecomm/k65doc.arc - the documentation
8bit/Telecomm/k65src.arc - the source code

OmniCom by CDY
Emulates: VT100
Text: 80 columns in gr.8
File Xfer: XMODEM, Kermit
Autodial: No
Archive filename: 8bit/Telecomm/omnicom.arc

VT850 by Curtis Laser
Emulates: VT100/VT102 (plus complete VT220 keymap)
Text: 40 columns in gr.0; 80 col. w/ XEP80
File Xfer: none
Autodial: No
Archive filename: 8bit/Telecomm/vt850b1.arc

What hardware has Atari created in the 8-bit computer line?
Computers:
400 (1979) 8-16K, membrane keyboard, 400/800 OS

800 (1979) 8-48K, two cartridge slots, 400/800 OS
1200XL (1982) 64K, early XL OS, F1-F4 keys, 4 LEDs
600XL (1983) 16-64K, BASIC, PBI, XL OS
800XL (1983) 64K, BASIC, PBI, XL OS
800XLF (????) ?????
65XE (1985) same as 800XL minus PBI
130XE (1985) same as 65XE with 128K plus ECI
800XE (1987?)same as 130XE but only 64K. Mostly eastern Europe.
XE Game System (1987) same as 65XE plus Missle Command, detach. keybd.

Peripherals:
410 Program Recorder (Japan and Hong Kong versions)
810 Disk Drive SS/SD 90K with DOS 1 or DOS 2.0S, MPI&Tandon vers.
820 Printer (40 col.)
822 Thermal Printer (40 col.)
825 Printer (80 col.), req. 850
830 Modem (300 baud acoustic, req. 850, with Telelink I)
835 Modem (300 baud, with Telelink II)
850 Interface Module (4 9-pin serial, 1 15-pin parallel ports,
beige & black metal versions)
1010 Program Recorder (Sanyo and Chelco versions)
1020 Printer/Plotter (print/draw in 4 colors)
1025 Printer (7-pin dot matrix, 80 col.)
1027 Printer (80 col., letter quality)
1029 Printer (7-pin dot matrix, same as Commodore MPS-801)
1030 Modem (300 baud, with 1030 Express!)
1050 Disk Drive (SS/ED 128K with DOS 3 or DOS 2.5)
XC11 Program Recorder
XC12 Program Recorder
XM301 Modem (300 baud, with XE Term)
XMM801 Printer (80 col.)
XDM121 Printer (80 col., letter quality)
XF551 Disk Drive (DS/DD 360K with DOS XE)
XEP80 Interface Module(80 col. video display and DB25 parallel port)
SX212 Modem (1200 baud, rarely with SX-Express! package)

Atari 8-bit vaporware computers: (note some are more vaporous than others)
1400XL 800XL plus modem, speech synth.(looks like a 1200XL)
1450XLD 1400XL plus 5.25" floppy drive
65XEP 65XE plus 3.5" floppy drive, 5" green monitor
65XEM 65XE plus AMIE sound chip

Atari 8-bit vaporware peripherals:(note some are more vaporous than others)
815 2 x SS/DD 180K with DOS 2.0D
1064 64K RAM module for 600XL
1090 XL Expansion System, for PBI, CP/M/MS-DOS/Apple II compatible
XM128 12" green monitor w/ built-in 80-column card
XC1411 composite 14" color monitor
XF521 5.25" floppy drive - 1050 compatible, in XE style
XTM201 non-impact printer
XTC201 non-impact color printer

>Ben,
>
>Thanks for all the hard work you put into starting and keeping alive
>Atari Classic. It is appreciated by many; even me although I never
>subscribed to AC. To be fair, I never voted that I would support it
>nor did I take a free copy.

I know what you mean. I follow this group almost religiously, despite not having my Atari 1200XL for eight years now. I'm seriously considering acquiring one again, although my wife thinks I have too much junk lying around already. :)

>I know how emotional the whole subject of Atari computers is. Of all the
>computers I have used or am using, my Atari is the only one that I had
>a real emotional attachment to. I have had (and still do) my first Atari
>400 for over 10 years. Of course I added a lot of software and hardware
>over the years. I still have most of it and can't seem to let go. Even
>though it has been a couple of years since I used it in earnest for anything
>but playing games, I can't get rid of it.

Again, I agree. We now have two 486 peecees at home, and they're great for what we're doing, but I feel no particular attachment to them. I used to have an Apple IIe (~1985-1990); again, no attachment. I don't miss it at all. I have a slight attachment to the first computer I used--an old Trash-80 CoCo (~1980-82)--just because I learned how to program on that computer. I was 15 when I first started programming it, and it made my career path--a CS degree and a job as a programmer--crystal clear.

But the Atari was *very* special to me. I kick myself mercilessly for letting it go. I had so many cool old games...my brothers and I would get together every Sunday evening for a few years and play games on an 800 for hours and hours. *sniff* Damn, I miss that thing. I have the *incredible*--but sadly unsatisfiable--urge to play M.U.L.E. and Archon on the Atari all day and night.

Even Ultima III on the Apple and PC aren't the same without the music the Atari version plays...

>As far as AC goes, I didn't subscribe because I knew that I wouldn't get
>any use out of it. I know that I will never go back to doing any serious
>work with my 8bit. Over the years, though, I have supported many Atari

>I had about 4 or 5 years of Current Notes, but I found a good home for
>them. I even had several issues of Softside (I'll bet a lot of the readers
>of this group don't even know what I'm talking about with that one).
>I even supported Aladdin for a year (for $75), and still have them. I
>used to subscribe to Compute! when it supported the Atari and even have a
>couple of issues of ROM magazine (but got them free at CES). I subscribed
>to the official Atari magazines under various names for a couple of years
>too. Today, I wouldn't subscribe to any of them either, which is why they
>aren't around anymore. Other Atari users stopped supporting them also.

Antic... *sniff*

I still have my old "Your Atari Computer" book. I have to hold onto
something for sentimental value. Maybe I'll get to use it again soon.
I'm becoming more and more determined to relive my early college years...

>I think AC came too late. Atari users have grown acustom to not having
>a printed magazine to call their own and don't want to shell an extra
>$25 a year to get 6 issues. In my case, that decision had nothing to do
>with the size, content or editorial staff of AC; it was strictly a decision
>based on how much use I would get from a subscription.

The value of nostalgia is easily worth it to me. I recently bought about 15
old issues of Computer Gaming World, from about 1982 to 1985--the years I
was most into the Atari. The memories they brought back were easily worth
$5 per issue.

>So, personally, I mourn the passing of another herculean effort to keep
>the Atari 8bit alive. In another 10 years, whenever I look at the boxes
>of Atari 8bit stuff in my closet, I'll think of AC and have half a smile
>in my heart but a tear in my eye.
>
>Thanks Ben & staff...

Atari 8-bit users are a lot like hockey fans in my opinion: relatively small
in number ('cept in Canada, of course), but *fiercely* dedicated to their
pastime. I think the Atariphiles *know* they have to band together in support
of their machine if it is to remain usable in today's world...

I was just wondering how much of AC's demise could be attributed to the AC policy of paying $25 for articles. At Current Notes, Joe Waters doesn't pay our authors (or editors, or columnists), in case anyone was wondering, or hoping to get rich. If someone were to restart AC, the best bet would probably be to abandon the payment policy and go to a newsletter format. That's what a lot of the European 8-bitters do. It would be nice to see how New Atari User manages to survive as well. (Bi-monthly, 8-bit only, European, Glossy).

1478. Re: U.S. Doubler. Anyone remember this?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-01 17:54:45 UTC
From: cb541@cleveland.Freenet.Edu
Message-ID: <2nhn56$qou@usenet.INS.CWRU.Edu>
Source record: 102309

(Mark S. Wyman says he wants to install a U.S. doubler in his
1050 and transfer AtariWriter files to IBM.)
The SpartaDOS construction set documentation, which is what
FTe is now selling for $19.95, I believe has seven pages, including
a picture of the 1050, of instructions on installing the doubler.
I believe that if you check FTe's phone # in the FAQ that
was just posted,(hold it, you need the vendor list.) Check
FTe's phone # in the vendor list and order a copy of SpartaDOS
construction set's book. Ask them if it has the docs on
U.S. doubler installation. Then you could use 'util.com',
a program that allows reading MyDOS disks, dbl dens. Actually,
get MYDOS 4.5 from the archive first. If I remember correctly,
my XT clone reads/writes MYDOS single density disks using
'util.com'. (See util.arc in the umich archive and MYDOS 4.5
in the same place.)
Finally, you will have to finagle your Atari files to make
them have ASCII returns instead of ATASCII 155s.
Russ Gilbert

1479. Product Announcements

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-01 18:01:48 UTC
From: Reaser@MT2.LAAFB.AF.MIL
Message-ID: <2D9C5FD8@POST3.LAAFB.AF.MIL>
Source record: 102310

Current Notes is going to try to handle 8-bit product announcements a little differently in the future. Joe Waters would like to put them in the "Product Announcement" section of the magazine. (Clever idea, huh?) In the past, I've done product announcements in my monthly column. Of course, no one ever gives me any product announcements--I have to pry the info out of vendors, developers and what-not. Here's what I would like to see: Send me an e-mail, when something new comes out with all the particulars and we'll run it for free (we do now). A product announcement is slightly different from a paid advertisement, in that it is text only and contains factual info on capabilities and availability. It 's like a press release.

Now, new PD/Shareware counts as new products in our minds. So, if the QWK8 guy wants to send me a "news release" that's great. The purpose of product announcements in Current Notes is to keep the readers informed.

We'll see how this works and if it doesn't, I'll have to go back to the old method method of calling on the phone and getting out the dental tools. (I don't want to do that anymore.) Some people (who will remain nameless) have promised to send me little product announcement e-mails in the past, but have yet to do so. (It's incredible that someone would pass up free "advertising.")

Don't let me down, OK?

In response to Mike Hohman's [wounded] response to my previous post...

Uh, sorry Mike, I didn't intend to pick on you or criticize FTE. Certainly the resrrurection of the ICD/OSS product line is a godsend to us all, & you'll not find me complaining about that! And I quite agree, sprucing up the code & fixing some of the ACTION! & MAC/65 bugs is a job that's long overdue & a definite step in the right direction. Those bums at ICD *should* have done it years ago, I'm really grateful that at last those products are in the hands of someone who actually CARES.

I guess I dashed that off a bit hurriedly & maybe didn't express myself accurately. What I was trying to say was that, even in their finally perfected form, products like RT8 & MAC/65 & ACTION! & SDX-- sound products tho they are, are not NEW. I mean, gosh, some of those OSS carts have been around for 10 years. I have nothing against upgrading, but you don't stimulate a sluggish market, or create a dynamic one, by selling upgrades of old products. Especially products geared toward programming. I don't have any actual figures on this, but I have a real strong hunch the majority of users aren't oriented toward programming. Applications & games are where the action is at in terms of developing genuine excitement in the marketplace. Also utilities that will permit software interfacing of our old hardware to newer technologies such as the various new hard drive protocols (like IDE) or allow us to easily take advantage of the newer inkjet & laser printers.

I guess maybe I'm just hungry to see a product representing a totally new idea appear in our market. Or at least, a totally new approach to an old idea that completely blows away all previouis attempts to perform the selected task. Does anyone doubt that I REALLY yearn for a graphics package that delivers on all the promises Graphic Master made but never kept? (For those who don't know, Graphic Master was a DataSoft program that promised the ability to draw everything from electronic schematics to chemical structures. It was hard as hell to use & it's graphic libraries for electronic symbols were pathetic. The chemistry symbol library was worse than pathetic, it was a cruel joke.)

I apologize if my comments sounded like a cheap shot at FTE, I certainly didn't intend that. I really terribly jaded, I just can't get personally excited about the re-introduction of old products when it seems to me there are a million new ideas that are in dire need of exploration.

I know, I know, FTE is only one small company & they just can't do it all. You have to start somewhere, & it certainly makes good sense to start by sprucing up some of the tried-&-true products that already have a following among the faithful. But gosh whiz, Mike, what's taking you so long? You've had three whole months now, certainly enough time to develop AT LEAST 70 or

80 whole new products! (Ummm... I hope that doesn't sound like a totally outrageous/unrealistic demand or anything... :) .)

Maybe it's rather tough to yearn for totally new things without expressing boredom & disdain for what's already out there. Didn't mean to step on anyone's toes.

Believe it or not, Mike, I'm on your side. Friends again?? Huh, please??

(BTW, it took me about a month to write the business plan for AC. Then another 2 months to iron out the kinks & get Unicorn to approve it. 'Course, I was doing this part-time, while I worked at my real job.)

Wearing egg on face today...

1483. 800XL Info/Advice Needed

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-02 00:10:05 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404012352.AA19353@phinet.smithkline.com>
Source record: 102314

I was just eyeballing Richard Dell's advice on connecting the Atari's CV output to a TTL or multiscan monitor.

I duuno, Richard, I think it can be done more simply than you suggest. Take another look at the December 1993 AC, especially Bob Woolley's TTL conversion articles, & also the article describing how to hook up the 8-bit to a multiscan monitor. You have to get the right brand of multiscan monitor to do it, since most MS monitors on today's market don't sync at the 15.75KHz CGA frequency the 8bit uses.

The simple way to have 80-column MDA-TTL monchrome video is to just pick up an XEP-80 & do Bob Woolley's simple TTL conversion as described in the December AC. I tested it pretty extensively myself & made my comments about it in Bob's article. There's also Bob's 40-column TTL conversion, not quite as good, but still decent. Of course with those mods you lose color altogether.

I discussed possible VGA conversions with Bob Woolley a few times, but we both concluded that it probably isn't possible (not within anything like reasonable cost constraints).

Woolley's TTL mods at least have the endearing feature of being easy & cheap; if you don't like the results at least you aren't out much.

- Ben Poehland

1484. Reading Sparta DOS and regular Atari DOS

Newsgroup: comp.sys.atari.8bit

In response to Winston Smith's comment, "...I'd hate to see the forward momentum lost..."

Well Winston don't give up on AC just yet. Something akin to what you suggested is actually in the wind, via some people from the San Leandro club in California. I devoted a paragrapgh to this in my February editorial, & there will be MUCH more detailed info about it in the April issue.

AC in its present incarnation needs a minimum of 500 paid subs to stay in business, which we now know is not achievable. The guys in California are well aware of the problems that brought down AC & are still willing to crank out a "resurrected" AC even if it means they only have 200 or 300 paid subs.

I've been coordinating my efforts with theirs as closely as conditions permit, so the final issue of the "present" AC will in effect serve notice to all readers that the spirit is there if the flesh (or rather, the wallet) is willing. My hope is that there will be a substantial degree of continuity in the new magazine with the old. Bob Woolley, himself a member of the Staff of the present AC, has spearheaded the "California AC Resurrection Movement", so it's not like the whole idea of AC is just going to drop off the edge of the earth.

At least, if it does, it will be because no one supported it.

poehland%phvax.dnet@sb.com wrote:

You are looking for a whole new approach? Well, there are some new approaches to consider.

The idea of the STATIC 6502 is an interesting one and I don't know where that can lead. However, a 65802 hack for the 8-bit could provide almost twice the throughput with converted or native 802 code. Considering the difficulty (near impossible) of throwing a chip with a greater clock speed into the 8-bit, using an 802 off the regular 16-bit address bus with an OS toggle seems like a rather simple hack and one which, if enough people do it, will lead to a second strain of 802 converted software and new applications which may only be posible using the new opcodes and features of the 802.

I am not qualified to design a prototype board. But I know several people who would be, and all we need to do is convince them to do this, and document what they did so that the novices like me can follow suit, or that person could be an entrepreneur and also offer premade boards similar to what was done with SIO2PC and GAMELINK. The people who might be able to do this includes Mike Hohman, Alfred, Chuck Steinman, and maybe Bob K of K-Products, and probably Bob Puff could do it.

The 802 hack isn't THAT complex it seems. It requires pin reassignment and adding the halt? line and then plug and go. The other half of the upgrade would involve a routine OS toggle, either using 2 EPROMs stacked with a switch or one banked EPROM. Only the former is anything that requires any new experimentation.

The OS would be dependent upon Chuck Steinman allowing his T816 OS for public use and duplication (or perhaps just selling the chip on a case by case basis for a nominal fee like $20 at the most).

The benefit of the 802 is its simplicity and its compatibility. One does not need to learn how to program for 24-bit address bus extended RAM. You merely continue to program for banked RAM. Technically, it is much easier and cheaper to do this than to build a whole new bus of RAM and then praying that applications would get written to address this RAM.

With 4meg upgrades and the colorvideo upgrades, this 802 hack would be routine for the hacker.

A deal would have to be struck for someone or a group of people to order a run of chips. I do not even know the availability of these chips. Chuck has trouble getting 816s so this may be THE problem to deal with.

So everybody, what do you think about this one? Would you do it? IF it only cost like $30 or so in parts to do it, how can you lose? The T816 was a major outlay of cost and hacking, whereas the 802 can be a painless and simple hack which die hards can do in anticipation that programmers will support it.

: >

: Do you have adequate documentation on the SC-01 chip? I have the data
: sheet for it, and an article and construction docs (with software printouts
: for the chip used .. can't rmember if it was a 6800, 6520, or 6805 or what)
: from the Steve Ciricia speech synthesizer project, as well as reference
: articles on speech to phoneme conversion (dated .. this was like 10 years
: ago). The data sheet, at least, may be useful to fill in any gaps in your
: documentation.

The problem is finding out (and I don't know if I WANT to find
out) just how directly the chip is mapped into the archetecture. I fear
that it is NOT directly accessible the way Pokey is. Bob Puff told me
that both the speech chip and the modem were handled by the Atari
1400/1450 as PBI devices. I don't know if you can "poke" to a PBI
device?? I do know that you CAN multitask with the chip, since the self
test speech will run over the sound demo or whatever demo you run as it
is talking. It does not tie up the CPU at all. In Basic, however, the
chip will take control of Basic and no other lines will execute until the
chip is done talking. It goes without saying that this hardware solution
never blanks the screen and allows use of Pokey simultaneous to the
speech chip as opposed to blanking the screen and using POKEY for
digitized speech like SAM does.

Unless the self test code is "stuffing" the chip off a VBI then I
would be inclined to think that it is possible to program VIA ML to
multitask the speech, but I still have no evidence that you can change
the pitch so I am uncertain. Perhaps this explanation of the self test
mode can give you an idea if it may be possible.

It is probably possible to disassemble the 512byte handler, but I
don't know whether this handler is only for Basic (ala the ZHAND for the
R-8) or is also a means to access it directly.

There is something very screwy about the system because the
speech chip appears to be an EPROM. I do not associate a sound generator
with an EPROM with RAM on board, however it does "process" V: input and
pauses for a split second so I bet it has routines on board which it

processes somehow before spitting out a sentence.

The 1400XL OS itself does not seem to have any special speech handling built in, it seems to load off the Speech chip itself! This is why I can now use my MUX with speech. A rather serendipitous advantage as I had thought during previous difficulties with the speech chip and MUX that the twain could not coexist but Bob Puff proved me wrong, that that problem was probably due to some flakiness in the system (mostly caused by my bumbling).

Considering the fact that the Alien Voice Box can "sing" while hanging off the SIO is encouraging, however. Studying the Voice Box software may lead to insights. It seems the speech chip was designed to be talked to in a semi-indirect manner to begin with so I dunno. I believe this is also the chip used for the Cheep Talk interface but I'm not sure.

It should be noted that it is important that pitch can be altered because the monotone of the 1400XL speech is not as good overall as SAM. But SAM is not viable because it blanks the screen so both have catch-22s associated with them.

1488. 1400XL

I got my 1400XL at Ameerican Technavision. I was yakking with the guy, bitching & whining how Bob Woolley had a 1450XLD & all the really neat cool hardware because he lives right there in California where all that stuff grows on trees & spent all his weekends doing nothing but running all around snatching up all the good stuff & squirreling it away in that infernal attic of his where no REAL 8-bit lover like me would ever get to see it... blah-blah-blah...

I think Ralph Maddox took pity on me (or, maybe, he just wanted to shut me up so I'd get off the phone), but just like this he says he's got this 1400XL around if I wanted it, tho the color in the video output had failed, etc. Well I was tickled pink. He charged me $50 for the thing & shipped it labelled "parts", which was close to the truth. I had to buy a new upper case & side panel for it. The upper case is identical to the 1200XL, & the side panel of a 1200XL can be modified to fit the 1400XL, so at least the thing isn't sitting there *naked*. The bottom half of the case is custom-fit to the 1400XL board, & there were no RF shields.

The thing was filthy inside & out, I spent a lot of time cleaning it up. After a bath & new suit of clothes it looks fine, but otherwise has witheld its secrets.... >sigh<

: I didn't use BobTerm very much. Not because it isn't an excellent piece of
: software, but because I was too cheap to register it when I already owned
: Keith Ledbetter's SX Express!. (My apologies to Mr. Puff- but at least I
: was legit).

Hmm. To do just one font with 2 adjacent characters would require every
combinations of 2 visible characters. I don't see how this was even
possible. In Flick it is not only going to do VT100 but some limited
ANSI in an IBMASCII subset, the high ascii subset has not been written in
stone yet. Just recently Clay asked whether the cent and fraction
symbols were necessary. I see the 1/2 and ^2 characters on PCBOARD via
PabQWK often, and also of course the dithered blocks and the happy face
an border characters. I never see the cent symbol or the note character.

This is one of the drawbacks to using a font rather than a blit. With a
blit you can have as large a set as you want, with fonts you justhave
your standard 128+128inversed which is not the same as the IBMs true 256
unique ones. Thank God most of the IBMASCII characters are used
infrequently or are totally useless to begin with. Makes sense doesn't it?

I'll take just about anything as long as I can go 14.4 in 80 collumn VT100.

OK Glenn, drop me a postcard with your email address on it. Getting the 1400XL up to speed is one of those "future projects" for me. I will be virtually 100% tied up, probably until Septemeber, getting out this final issue of AC, sending out refunds, & winding down affairs with Unicorn Publications. After that.... hopefully I'll have time to look further into the belly of the beast.

BTW, my 1400XL arived WITH its custom power supply, so it DOES work. The power supply is one of those awful Atari brick-style things. But it's the biggest damn brick I ever saw, we're talking the Mother Of All Bricks here. Easily twice the size/weight of the brick for the 800XL.

I know the voice thing works, too. I had it on my bench & was doing something to it, going to the OS I think, & sudenly the computer spoke up & introduced itself to me as an "Atari Home Computer" or some such... startled the daylights outta me.

Atari's research department must have been a true Wonderland 10 years ago.

Terry Conklin states, quite inaccurately, that I have "... harped on the net about the Evil Non-Subscribers..." & claims I referred to them as "...traitors, scum, and worse...".

That's an outright lie, and I take strong exception to it.

Just why Terry Conklin has suddenly chosen to make war on me, & the efforts I've given to AC, is beyond my understanding. Quite clearly the man has some kind of personal problem or fixation concerning me, & is in need of professional help.

Anybody who cares to flame me privately is always free to do so, but to make such a pathetic display in this forum is at the very least discourteous to other readers. I refuse to soil this medium as Mr. Conklin has, by responding to his rude remarks or even taking them seriously.

Is this true?

Commadore was marketing its composite monitors quite aggresivly during the C64 period, I find it hard to beleive that Atari equipped every model of its computer from the 800 up (sans 600xl) with composite output and never marketed a monitor.

Anyone know for sure?

Steve

It would be feasible to convert the Atari to a monochrome TTL output and drive
an appririate multiscaning monitor (one that does tthe 15.75 kHz). You could
even pick which color you wanted it to be (assuming an RGB EGA-type monitor).
But of course, then you lose the color information, and it is no longer the
same display. I guess what I mean is that it would no longer be adapting
the Atari's composite video output to display on the monitor, but adapting
the Atari's 'type of video' to display on the monitor, losing some of the
display conent on the way.

On the Steve Circia board, the pitch programability comes from a variable
oscillator, separate and additionally from that in the SC-01. THe SC-01
has provisions for 4 course pitch changes, his circuitry adds 16 dvisions
to these levels.

Hmmm ... the SC-01 data sheet has a sort of standalone circut implementation
consisting of the SC-01, an EPROM, and a couple of loadable counters and
other interface chips, which looks like it would generate fixed 'words'
when loaded. Does the V: handler interprete general typed text, or only
certain words?

>

The SC-01 has two pitch control inputs, direct inputs, and 6 phoneme inputs,
strobed into a latch. It looks like the Atari might have the pitch control
inputs hardwired to select one pitch. Pins 2 and 3 of the SC-01 are the
pitch control. This is a course level of control, thus Ciricia's Microvox
added the 16 levels to it with external oscillator circuitry. But if
pins 2 and 3 are hardwired high or low, they would not be programmable.

In use, the phoneme data is presented on the 6 data lines, then strobed in
with the strobe line on pin 7. When the SC-01 is ready for another phoneme,
it toggle the ack/req line on pin 8 (of course it toggled to ack the strobe).
In the EPROM based word circuit, this counts an EPROM address counter to
get the next phoneme. In a microprocessor based circuit, the micro would
present the next phoneme. If there are counter chips in the vicinity
of the EPROM and SC-01, and the data line of the counters go to the EPROM,

it would look to me like this is the minimal stand alone word implementation.

Subj: Atari Classics

Dear Ben

When I received my copy of the February 'Atari Classics' a few days ago I experienced a real sinking feeling as soon as I saw your headline "...'Finito'". I am very sorry to hear that AC will have to cease publication due to lack of subscription support, especially after the superb efforts put in by yourself and your dedicated team over the last couple of years. It must be a tremendous disappointment to see those efforts thwarted by apathy in the 8-Bit community, but I for one certainly appreciate the way in which you presented the Atari Classic machines as serious computers - far better than Antic or Analog ever did - THANK YOU very much.

I regret that I cannot do anything more positive to help (unless you know different!) but I certainly will NOT be looking for any refund of my subscription. Please consider any surplus as a donation to the AC cause - a minimal recompense for all your unselfish work. I would suggest that in drafting your plans to close AC down smoothly, you ask subscribers whether they actually want any refund. I am sure that many will feel as I do. Perhaps if there are any surplus funds left, they could go to help the SLCC Consortium (or someone else) get a future magazine or newsletter off the ground.

Although I am only a telecommunications novice, I did wonder whether there might also be a future in some form of online magazine, say in the Atari8 Forum on CompuServe. I would be interested in the views of yourself or any of the AC communications experts.

With very best wishes - Terry Chamberlain,
Macclesfield, England.

I am looking for BBS software packages, (as I'm considering to
start two 8 - bit BBS's here in sweden)
I dont know what there is, I've heard of BBS express! & PRO, are they
any good?

I'm also looking for an 850 manual,
an 850 altogether, (or similar), device.

As I may write my own BBS program in turbo basic XL so I'm particulary interested
in the 850 manual and sources for different file transfer protocols.

What will the modem-through option do to the sio2pc chematics?
Will it just be a software mod to the executable program?
I'd really like to see this, as it may make me skip the 850.

CC: POEHLAND
Subj: RE: Atari Classics

Hello Terry,

Many thanks for your expression of sympathy & kind words of support for the efforts of myself & the Staff of AC to keep an all-8bit publication in the market.

I'll not be able to honor your generous offer to withold your refund & keep it as a "contribution", deeply touched tho I am by the gesture. The magazine's policies for awarding refunds have finally been worked out & will be applied to all readers without exception.

Your proposal to poll the readership to see who wants refunds & who doesn't is interesting, but regrettably impractical. It would involve a 400-piece mailing which would not only be time-consuming but expensive.

From a moral point of view, I'm not sure if I have the right to simply hand over the magazine's treasury to our Californis colleages anyway. AC has been undersubscribed for most of its history, which suggests a reluctance on the part of the community to support the concept of a community-produced publication. By giving everyone back their money, & offering them the opportunity to renew their faith in the original concept (the mechanism for this is provided in the forthcoming April issue), we will in effect be conducting a referendum on the idea of having our own community-generated publication. I cannot take unto myself the decision to continue the magazine by arbitrarily turning it over to other interests under the existing circumstances. This is a decision which the community itself must make. Users will be asked to vote with their wallets.

I've forwarded your letter to our Telecom Editor, Lawrence Estep, for any comments he may wish to make regarding your proposal for an on-line type of publication. There was much debate about this in the USENET newsgroup back in 1991 prior to the kickoff of the 1992 Mail Campaign. I'm opposed the idea personally, on the basis of the fact that on-line mags only reach the 15% of users who own modems. A print-medium publication allows you to print copy from advertisers, reaches more people, & embellish articles with photos & diagrams (especially necessary for hardware articles). Of course, if such an effort is what the community desires, & someone will step forward to manage it, that might be the way to go.

It is still premature, at this point, to write off AC entirely. My advice to all readers is to adopt an attitude of wait-&-see. Wait for the April issue

& see if you like the style of what the SLCC people are doing. Make your vote
if you are so inclined. Give those guys a chance to count the "votes" & see
if they do indeed decide to rekindle the AC flame. Let's not be in too great
a hurry to bury AC until we're certain it really is a corpse. Until then,
I recommend all discussions of future alternatives should be postponed.

Again my deepest thanks for your interest & support.

Kindest regards,

- Ben Poehland

Personally, I would rather have the information organized and digested into a newsletter. One thing AC could have done better was to lower its standards of what made good 8-bit news. Jeff Potter has apparently written a nifty sounding game, but I never heard of it before. Maybe some sort of "Lotsa little tidbits about people in the 8-bit world" column would have been useful (The Apple II newsletter, "Shareware Solutions II," does a lot of this sort of thing. It's not a *great* newsletter, but I like the folky aspects of it).

There is also at least 1 current palmtop that uses the 186. I've always thought of it as the 86 done right, with many instruction cycle counts reduced to reasonable levels (effective address calculation is 1 cycle in the worst case, instead of up to 12).

That's exactly how I feel. Since the market dried up around 1988 or so, there have been almost *no* exciting new products. Hardware hacks and upgrades are fun and useful, but what good are they without software? Almost all the "new" software has been of the "trifling utility" sort, such as a program to convert cassette games to disk format. A bunch of new games have come out of Europe, but they seem to be misguided attempts to out-flash the current crop of game consoles than classic 8-bit fun.

I guess what I'm saying is that anyone wanting to write a new, commercial 8-bit product should try really hard to climb out of the tired old muck. A new and different 8-bit game would get my money, if it wasn't just a hobbyist attempt at cloning Ultima. (Hey John Harris, finish up Banskter and sell it mail-order for $10. Seriously.)

: - Ben Poehland

My 1400XL board is not identical to others, in fact I would consider it inferior due to the flawed PBI design, so I can't claim that my findings will be identical to yours. However, if you boot your machine after first removing the SPEECH EPROM then you will notice MEMLO is 512 bytes less and speech is inaccessible.

As far as I know speech is generated due to the presence of this chip alone, and with it removed the machine acts like a 65XE plain and simple. If the SC-01 is a series of chips and not just a combined EPROM then I can not find any trace of what I would consider to be another mapped in custom chip. Just Freddie, the rest of the standard chips, Basic B and the OS. And I have already proven that the OS is stock XL/XE throughout and has no V: or T: code it in whatsoever. The Self-Test talking is ALSO straight from the speech chip as far as I know. I haven't tried putting a stock XL/XE OS in and going to self test to see if it would talk the same way--if anything is different about the 1400XL OS this must be the only thing, a few bytes in the self test code.

David Hunt who owns Carina said he used to own some speech demos for the 1400 series but I do not consider him a very believable source and although telling me he has them, he has not been able to deliver the goods. According to him the chip CAN sing. I am not a good enough hacker to know exacly how it is mapped in but it is feasible that it contains additional circuitry for greater pitch control ala Cheep Talk and Alien Voice Box. Since the Alien Voice Box was a contemporary of the 800 let alone the emerging XL/XEs it would make sense for Atari to provide at least comparable features for _its_ speech system. But knowing Atari you can't follow that logic too strictly.

It may be possible to get these demos from Atari corp. if they still have them. Considering that Bob Woolley's 1450 is a result of Bob Brodie dusting an abandoned one off and sending it to him, I do not feel as though Tramiel Atari keeps very good archival storage of any of its 8-bit software although be darn it will fight to the death to protect their copyrights of said software!

FlickerTerm is still in Alpha test, right now all the main work is being done to get the speed up and to work on the emulations, VT100 and Ansi. So far, everything is going well...it has very good VT100 support and a very workable Ansi support. As to the next step, that would be protocals, X,Y, and maybe even zmodem (Alfred is sending LonerSoft the source he's been working on.) Give it time, FlickerTerm will not be released until its ready. As to the Baud rate, FT80 keeps up at 14.4 (with modem compression turned off) w/o character loss. At 9600 it has no character loss even with modem compression turned on.

The only time Atari even announced monitors for the 8-bit was at the initial announcement of the XE series. I don't believe they ever produced any.

Their model numbers and brief descriptions are mentioned in the "Atari vaporware" section of the FAQ list.

A number of folk have pointed out that I did this, just goes to show ya ...

Anyway, to correct what I should have done right the first time,
the Atari Archives at atari.archive.umich.edu You can also get the 0index
file I talked about by BART... Send mail to atari@atari.archive.umich.edu
in the body of the letter write....
send 8bit/0index

This will get you a list of everything in the archives.

Mike

>...

Frank:
It sounds like you are trying to run the FP ROM's through your 6502
emulator. Does this mean that the atari emulator will require the
copyrighted atari rom code in order to run? I think you are asking
for trouble. Why include the atari code at all? You can intercept
any JMP or JSR to the rom address space and use a 'C' routine to
perform the function. All of the recommended atari subroutine
entry points can easily be implemented this way. There are a number
of games that make illegal calls to the atari ROMs; for these cases
the user can run the OS rev B translator. This method makes everything
legal and much faster because the Atari OS can be implemented in the target
machines native language. The only caveat is: does the atari translator
make illegal calls to the OS ROMs?

Food for thought

I have to disagree with Terry's opinion of the Super Video upgrade. The video on the XL DOES suffer from poor design that causes the composite signal to appear as a dim blur compared to an upgraded XL. It is possible that the XL he modified had another video problem. I have discovered that most aspects of 8-bit video are flawed by incorrect component values. It simply HAS to get better when you change to the correct ones. I feel that Warner dropped the ball on most aspects of the XL. We lost the expansion ports, The 2nd cart port, lost video quality, and lost 2 joystick ports. If Ben can improve on the XL, I applaud his efforts.

Hi All!

I have picked up an old ATARI 800 (sure i got three 800XLs but therefore no
800).
I powered this 800er with my Power-Supply from my 1050, but the Video-Output
is only avaible in Grey-Scales...equal on TV or Monitor-Port....

How can I find out if this Modell of my 800 ist NTSC ?
I only has an Color-PAL-TV and an Taxan Multivision PAL Composite Color
Monitor.

Wich Detail must I post to get an corrct Answer ?

(B)y (t)he (W)ay: One of my Modules (SHAMUS Part 1) runs only on this Machine
and fail under the XLs

THANX for Replys....
Guido

Given the lack of 4-joystick games, it wasn't a great loss. Banking was
a far greater priority. If they had the chance to do it over again they
should have merely slapped another PIA on and left PIA1 alone, though.
That would have made a LOT of things easier.

The second cart port was veritably useless as well. Stacking carts has
been able to do what the 2nd cart port was probably best suited for. I
have a tower of the MUX cart for I/O, R-time8, and a 3-way OSS language
supercart. It all works fine and I can disable the languages from Sparta
witha file. As soon as FTE makes a MUXable SDX I will add yet a 4rth
cartridge to the tower.

You'll be hard pressed to find anyone who believes the 800 was better
than the XL/XEs. The ability to use the RAM under the OS alone makes the
XL/XEs better. Any cosmetic detail is not as important as the inner
workings. The Video can be fixed, but you can't add a PBI to an 800.
Certain XL/XE details you can't do on the 800, but what the XL/XE lacks
it can usually get via hacking.

1520. English Docs for ATARI 8bit emulator for MSDOS on wuarchive

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-03 19:41:31 UTC
From: ddbunch@infi.net
Message-ID: <ddbunch.765402091@wyvern.wyvern.com>

Does anyone have an English translation for German doc file created when you run the readme.bat out the archive AT800XL.ZIP on wuarchive? I got it to come up in basic by turning off my memory manager & loading my VESA driver, but can't get it to do much more than that. Also when starting the program hitting the F2+F4 brings up a directory of the files in your directory, but can't figure out how to get any of them to run. Perhaps being able to read the documentation would help. Anyone have better luck with this or have an English translation?

Here is where this file is in case you are wondering.

```
wuarchive.wustl.edu:/pub/MSDOS_UPLOADS/emulators/atari800xl
-rw-rw-rw- 1 3007 archive 129 Feb 26 16:54 at800xl.txt
-rw-rw-rw- 1 3007 archive 241347 Feb 26 16:58 at800xl.zip
```

Thanks in advance for any help.

This is so difficult to understand. I've been using IBM's for years now, but Atari is hundred times more confusing. I want to get files that I've downloaded with my 386sx to an atari 1050 disk (800XL.) The programs are all "term" programs so there is no way I can download them from my computer using phone lines. So then, I downloaded programs like UTIL and MULE, I don't understand MULE and UTIL only works with MYDOS disks. So now, I've gone and downloaded MYDOS but, it doesn't seem to have been compiled yet. So can someone please help me get the programs on my IBM disk to my ATARI disk with the correct DOS.

I would like for these programs to just pop on the Atari screen when I boot-up. How do I do this? Any help would be appreciated.

Jerry

So that I won't ask anything that would irk anyone, I would like to know if and where there is a FAQ on the Atari 8-Bit machine...

I am a CoSysOp for an Atari BBS in Slidell, Louisiana. The SysOp is a DEDICATED Atari owner/programmer. No one could ever change his mind about switching his board over to anything else. Besides, particularly in the summer, our BBS has the highest volume of local messages I have ever seen. So he is firmly intrenched and always looking for new ideas.

If you have any questions or comments, post them to the Atari digest or E-mail smwmn@uno.edu.

(Jerry Lineberry wants to get started on his Atari 8-bit from a IBM.)
Util only works on MyDOS disks. True, but you can format a MyDOS disk
on your IBM using UTIL, then put the stuff you want on the disk, then
go over to your Atari and read it. IF you have a boot disk for your
Atari that will read the MyDOS disk you write with your IBM. If you
don't have a boot disk that will allow reading the MyDOS disk, hmmmm...,
I guess you'll have to purchase one from CSS or FTe. See vendor
list.

Source record: 102259

: : 7) Again, a 1400 or 1450 or 1090 would be appreciated with lots of $$$.

: I have a 1400XL that works. The only thing that distinguishes itself in
: its present functionality is the voice chip. The design of this
: particular prototype did not have a fully functional PBI. The port is
: there but not even BOb Puff could get it to work. Also, the modem card
: has been removed and may not be functional, which is no big loss since it
: is 300 baud and uses a hardcoded T: handler which not much software will
: even recognize.

Odd...I don't know if My friend and I tried the PBI bus on it..
but I think we had harddrives running on it.

: It took me a great deal of money to make this thing work. It was a soap
: opera of getting a power supply made for it, fixing it after I tried on
: my own to hook a supply to it, slight damage in shipping, and getting it
: to work with the MUX OS.

: The initial investment was $175 for the board. I mus have put an
: additional $100 into it at least, for the 1200XL case I put it into and
: what not. I'm using it right now.

The case my friend has is a true 1400xl case.
And the power supply was a snap to convert over..bought a supply
at a show and just put on the correct connector... the voltages were
already correct...I can't remember what the supply was from though..

: I like it, but I am rather hesitant to try a memory upgrade on it,and if
: I do not, its functionality for a hard core user like me will be limited.

: If you REALLY want it, then make me an offer. The V: handler is fun to
: work with. The V: handler seems to load from the speech chip itself, and
: bumps MEMLO up by 512 bytes. This has not created any compatibilities
: with software so far, at least using SpartaDOS 3.2z.

Does it load from the chip? I was hoping it was in rom somewhere
so the concept of upgrading a 800xl to a somewhat 1400xl was not to
far out there..

1530. Re: Demise of AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-04 16:09:36 UTC
From: heller@akh104.rh.psu.edu
Message-ID: <2npe40$gbd@hearst.cac.psu.edu>
Source record: 102261

I agree that even a mimeographed (sp?) AC would be a joy to recieve
...however... something along the lines of DIGITAL ATARI CLASSICS..
distributed via the network.. would also be good... however...
the key thing about the networks is that there are hundreds of atari
8bit people out there who do not have access to the INN.

I know of at least 10 people personally, 2 rather closely, who
have access to BBS's only..and then only long distance.
There are SIG's for the 8bit on just about every network out there
including Fidonet, Virtual-Net...etc...

I think it would be a good idea to try to tie these sources together
by haveing those boards who have Internet feeds to pull the 8bit group
and mail it on its way to the other networked BBS.

This would make a fine medium for distributing DAC. (heheh)
Heck, I would set it up myself if I were not a full time student
and had at least 1 perm. address.

There are the money problems as usual... fidonet and other gateways
don't run cheap. However, It could be arranged that you could send
a monthly/yearly statement to whomever is the source of you news feed
. i.e. If I receive atari.8bit via a fidonet board in Jersey (say
because it has the internet/fidonet gateways and is willing to pay
for it for its own memember..or has its own members to pay for it..)
then I would send them a small amount of cash to have the Mail
routed down may way.. etc...

I would start with the Fidonet and Virt-net (VBBS).

If only a thought...

There are, like I said, a lot of us guys out here who can't
read this group simply because we don't know it exists or its
not distributed.

This will be a problem that I will face come graduation in December..
or whenver they feel like updating the accounts after such time.
Right now... this site, akh104.rh.psu.edu, is free with unlimited
bandwidth.... odd.

Message-ID: <2DA03080@POST3.LAAFB.AF.MIL>
Source record: 102262

In Current Notes, my monthly column is called "8-bit Tidbits." I cover current news and tidbits of info. I used to cover new products in the column, but we are going to try and move that to a different part of the magazine, much like is being discussed here in the newsgroup with the "announce" thing. We'll see how that goes. I also cover a lot of people and do the "name drop" thing as to what individuals are up to.

CN ran two articles in the March issue on Maze of AGDAgon complete with screen shot. I discussed my personal impressions of it in my April column. Compared to AC, Current Notes has carried more in terms of "Current News," probably because we have a greater publication frequency. (10 vs 6 time a year) Our turnaround time for an issue was also faster.

Rick Reaser
Atari 8-bit Editor
Current Notes Magazine

1532. Who Owns AC?

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-04 16:23:41 UTC

Ben:

Since you've stated on several occasions that AC belongs to the community, would it be possible to share with us here or in the last issue "the numbers" for AC. What would be interesting is the breakdown of what it costs to run an amateur publication, especially, if someone wanted to restart it. These are the critical numbers. How many subscriptions (disk and mag)? How much was collected in revenues? How much did the printing cost? How much did the DTP cost? How much was postage? How much were the labels and disks? How much was other?

I think the "community" would be interested in a short financial summary to get a feel for what this is all about and to see what, if anything, could be improved if the effort were restarted. Since we all "own" AC, it would be valuable to get this information into the community.

Source record: 102266

In a previous article, kamaro_kid@delphi.com () says:

>Is there a LISTSERV feed for receiving comp.sys.atari.8bit, rather
>than getting the entire digest at once??

There was once the INFO-A8 Listserv, but this was just a BITNET
distribution of the Info-Atari8 Digest. I'm not sure if INFO-A8 is still
around, as I have no BITNET accounts. Does anyone know?

What I suspect you really want to know is whether there exists a "bounce"
mailing list version of comp.sys.atari.8bit, as opposed to the "digest"
mailing list version, known as the Info-Atari8 Digest. A bounce list would
mail you every individual posting made to comp.sys.atari.8bit or mailed to
the mailing list.

The answer to that is no. But, our new Info-Atari8 Digest maintainers,
Mike Todd and Mike Jewison, might consider creating one. It probably
wouldn't be that difficult, and I can understand its advantages over mail
distribution in a digest. Many discussion groups have both options.

1544. 1400XL... NOT! (Sorry, Glenn!)

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-04 23:27:42 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404042310.AA29058@phinet.smithkline.com>
Source record: 102275

Oh, doofus me. Over the weekend I took another look at my "1400XL"-- wups.
It ain't a 1400XL, it's a 1450XL!
But, NOT an XLD! Atleast, it doesn't even remotely resemble the photo
Bob Woolley published on the front cover of the SLCC Journal of the 1450XLD
"Tong" board (Oct. 1991).
Woolley's Tong board had all the chips oriented vertically, from front to back.
Mine has all the choips oriented horizontally, the way they are in the 1200XL,
600XL & 800XL production models.

I seem to recall there were 2 versions of the 1450XLD... maybe this thing I
have is a non-Tong 1450??? Gawd, this is weird!

So to Glenn Saunders, I'm not sure if all that stuff I said in my earlier
posts still applies.

But there is GOOD news for any true 1400XL owners... there ARE schematics
available for the 1400XL!!! Yes, believe it! I gottum! $15 (ripoff) from
Best electronics. The diagrams are *horrible*, tho. Full-size engineering
blueprints, badly copied. Bleah! He claimed they were the same as for the
1450XL, I haven't had time to verify that yet. Apparently, tho, all the
14xx series machines DID have a FREDDIE... can't help but wonder if the
XE's are simply stripped-down versions of the 14xxXL machines. Hmmm.....

Is there anyone out there who KNOWS anything about any of this stuff?????

1546. Demise of AC

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-04 23:49:55 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404042341.AA29458@phinet.smithkline.com>
Source record: 102277

I just wanted to express my gratitude to Kit Kimes & others for their
expressions of support.
for AC & the concept of a community-based publication.

But please, no tears just yet! Back issues are still available ($5 cash or
check to Ben Poehland, 179 Sproul Road, Frazer PA 19355, for mags or disks).
We still have another issue in the works (it's about 65% finished).

And there's the SLCC guys. I suggest we all just watch & see what develops.
AC might be down, but rigor mortis hasn't set in yet.

1547. 800XL on the Fritz

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-04 23:59:37 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404042347.AA29538@phinet.smithkline.com>
Source record: 102278

I was just thinking I had an 800XL that died like that. Dead screen, hum, etc.

Sounds like a blown RAM chip (that's what mine was).

If it is, it'll be real easy to find. Open the case, turn on the power.
Run your fingers over the RAMs. They should all be cool. If one of them
toasts your finger (!), you found it.

The one that blew in my system was so hot it scorched my finger. It also partly
melted the socket (forntunately not bad enough to do permanent damage). The
hum is caused by the power supply being grossly loaded down by the short
circuit in the blown RAM, so that 60Hz ripple is coming into the +5V bus.

Even if this turns out not to be your problem, you can at least eliminate a
bad RAM as the cause of the problem, & it's easy to do without any test
equipment (except human flesh, heh.)

Hope this helps.

: Oh, doofus me. Over the weekend I took another look at my "1400XL"-- wups.
: It ain't a 1400XL, it's a 1450XL!
: But, NOT an XLD! Atleast, it doesn't even remotely resemble the photo
: Bob Woolley published on the front cover of the SLCC Journal of the 1450XLD
: "Tong" board (Oct. 1991).
: Woolley's Tong board had all the chips oriented vertically, from front to back.
: Mine has all the choips oriented horizontally, the way they are in the 1200XL,
: 600XL & 800XL production models.

: I seem to recall there were 2 versions of the 1450XLD... maybe this thing I
: have is a non-Tong 1450??? Gawd, this is weird!

: So to Glenn Saunders, I'm not sure if all that stuff I said in my earlier
: posts still applies.

: But there is GOOD news for any true 1400XL owners... there ARE schematics
: available for the 1400XL!!! Yes, believe it! I gottum! $15 (ripoff) from
: Best electronics. The diagrams are *horrible*, tho. Full-size engineering
: blueprints, badly copied. Bleah! He claimed they were the same as for the
: 1450XL, I haven't had time to verify that yet. Apparently, tho, all the
: 14xx series machines DID have a FREDDIE... can't help but wonder if the
: XE's are simply stripped-down versions of the 14xxXL machines. Hmmm.....

Ben,

My board says "1450" on it. No XL or XLD designation on the
board. There seems to have been several flavors of these boards, some
prototypes, some closer to finished boards. I believe that at one point
at least Atari was using the SAME board for the 1450 and the 1400. The
only difference between them being how they were finished off, i.e. the
1450 would have the drive and th 1400 wouldn't but internally they were
IDENTICAL. FOr someone picking up a board without case or drives, the
issue of whether they own a 1400 or 1450 is trivial. If they don't have
the daughterboard, and don't have the drives, it is a 1400. I call my
board a "1400" but I'm absolutely certain that if I found the
daughterboard and drives I could plug it right into the 34 pin connector
which is present on this board and make it INTO a 1450XLD.

They all have the built in modem and speech and PBI (but as you
know by what I got not all of the boards are fully functional PBIs) and
they all pull a 12v line from the power supply to power the 34 pin
conductor, whether it has the daughterboard or not.

The prints you got are the same ones that Bob Puff has I
believe. I asked Bob if I could get a copy and he told me they were too

massive. So feel free to call your board what you like, but considering the fact that those drives and daughterboards don't grow on trees, if I were you I'd call it a 1400 like what I call mine. If you call it a 1450 people will assume you have the drives going.

1549. Writer Stipends

Newsgroup: comp.sys.atari.8bit

Yeah, I'm sure Current Notes would be pleased to see AC discontinue its policy of paying $25 stipends to its authors. That would certainly benefit Current Notes, by putting AC on a less competitive basis for attracting the most talented authors.

Whether Jim hood will retain the policy remains to be seen.

I'll simply make the observation that, whatever problems AC has faced in other areas, at least the magazine has never gone wanting for material to publish. Indeed, the most difficult task I face for every issue is to decide what articles NOT to publish; hardly an issue goes by that I haven't apaologized to someone for not putting in their piece & promising to do so in the next issue. I'm very grateful to all the people who submitted material to AC. In rthis area at least, the response of the community has been nothing short of fantastic.

It's hard to say whether AC's stipend policy encouraged authors to submit to AC over CN. All things being equal, it could be presumed authors would prefer to submit their material to the publication that would at least compensate their out-of-pocket expenses, which is what the stipend is for. (Certainly no one gets rich writing $25 articles.)

All things are not equal, however. AC has greater visibilty in the 8bit community than CN ever did. When I was 8bit editor at CN I found it tough going to get 8bitters interested in CN. Why, I'm not sure. Typical responses I got were "It's too expensive" & "I resent paging thru 70 pages of ST stuff to get to the 10 pages of 8bit stuff". It was a hard sell. Authors know it, too. They want their articles to appear in a publication most likely to be seen by other 8bitters.

Also, some authos submit material (such as machine-language programs), that have to be communicated on disk media. (M/L stuff can always be posted somewhere, but reaches only the 15% of readers who use modems.) Current Notes doesn't distribute an 8bit disk, whereas Atari Classics does. In fact, AC's disk was oversubscribed by 300%, which helped keep the magazine going since magazine subs were underfunded. People really WANT that disk! Authors know this, too, so they gravitate toward the publication that can present their work on disk to readers who don't have modems.

My advice to Current Notes:
a.) Offer author stipends
b.) publish a disk
c.) resurrect the old policy of discounts for usergroup members.

1550. SC-01 Speech Chip

Newsgroup: comp.sys.atari.8bit
Date: 1994-04-05 00:57:28 UTC
From: poehland%phvax.dnet@sb.com
Message-ID: <9404050042.AA00452@phinet.smithkline.com>
Source record: 102281

After reading posts by Richard Dell & others on the 14xxXL machines with the SC-01 speech chip, got me to thinking about this thingamabob 1450XL (or whatever) I have.
The SC-o1 in my machine appears to be embedded amongst the circuitry for the modem. There no EPROMs in the vicinity. There ARE 2 EPROMs some distace away, whose function is a mystery. They aren't like OS ROMs or anything, as I've already identified the usual XL OS ROM & BASIC ROMs in there, these EPROMs are extra. There's also at least 4 or 5 PALs in there. One of them undoubtedly an MMU, but what are the others for?

BTW, the SC-01 was NOT the chip used in Cheep Talk, that was something entirely different. Same metallic monotone voice, tho.

This SC-01 is an odd size chip. Smaller than a 40-pin LSI, larger than a typical 20-pin TTL gate. I studied the photo of bob Woolley's 1450XLD very carefully & was unable to locate anything the size of the SC-01 on his Tong board. Weird, weird, weird....

>make illegal calls to the OS ROMs?

I think that the first release should just use the OS ROMs. Most of
us have an Atari, so this isn't a copyright problem, since we already
own the rights to use a copy of the OS.

On the other hand, your suggestion is an excellent idea for Version
2.0. Version 3.0 should intercept calls to DOS and implement them in
C, giving direct access to the host machine's file system.

Right now, I just want to see 1.0 (or even 0.9).

Kinda makes me wonder if Atari may have had something customized containing
SC-01 circuitry and/or other logic, as well as perhaps an EPROM or ROM. That
might explain the differences in the layouts.

The SC-01a data sheet refers to a 22 pin package, about 1 1/8 inches long
by .400 inch lead spacing. Slightly wider than the standard 300 mil used
for logic, but less than the 600 mil used for EPROMs. This should make
the chip relatively unique.

A few weeks ago I posted that I had an ML Assembler and
an auxillary menu for Atari Writer Plus.
I am looking for a volunteer (or should that be victim)
that would be interested in any of these two programs, and
would be willing and able to upload them to the archive. It
would cost me quite a bit in phone charges to upload these
(particularly the Assembler and Linker and their manuals
which are quite large.

I would be willing to mail a disk to someone who has
the easy ability to do this. The person should preferably
have a double density drive so I could pack it with other
stuff I have written. This cosists of A couple ML games,
and whatever else I can find in my personal archives.

Thanks,
Ken Siders
